Collating Estimates of Wound Prevalence from Clinicians Leading Wound Care Programs in Healthcare Organizations Across Canada: A Proposal

STUDENTS Lohnes, K, BScN, RN, NSWOC, WOCC(C); Sistoso, K BScN, RN; Cameron, J BScN RN; Catching, A, B.Sc., BSN, RN
SUPERVISORS Houghton, PE, PT, PhD; LeBlanc, K PhD, RN, NSWOC, WOCC(C), FCAN

Background
- Chronic wounds are associated with decreased quality of life and poor patient outcomes
- The cost of care for chronic wounds is burdensome to the Canadian healthcare system
- The prevalence of chronic wounds in the Canadian healthcare system is unknown and the methods used to obtain prevalence estimates vary across the country

Objective
- Overall objective of this project is to establish an estimate of wound prevalence in Canada

Study Phases
- **Phase 1** will use a survey to locate health care leaders who are willing and able to participate in a database collecting national prevalence estimates. Existing prevalence data will be collected and collated.
- **Phase 2** will focus on creating a National Prevalence Panel to determine a consistent method of collecting the prevalence of wounds in Canada. A research team consisting of co-primary investigators will be identified.
- **Phase 3** will see the creation of a web-based database, software & collection systems, and relevant agreements to create a national database of prevalence data for use by Canadian health care organizations.
- It is anticipated that this project will span several years and involve a large research team

Anticipated Results

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase 1</td>
<td>Currently In Progress</td>
</tr>
<tr>
<td>Establish a network of clinicians willing to collaborate</td>
<td></td>
</tr>
<tr>
<td>Contributing healthcare organizations will include: Long term care, community, rehabilitation facility, community hospital</td>
<td></td>
</tr>
<tr>
<td>Literature review / Methodology development/ Survey Development/ Face and Content Validity / Pilot Testing/ Survey dissemination</td>
<td></td>
</tr>
<tr>
<td>Phase 2</td>
<td></td>
</tr>
<tr>
<td>Establish methods for data collection on the prevalence of wounds in Canada</td>
<td></td>
</tr>
<tr>
<td>Direct clinical exam over 1-3 days, the use of chart reviews/administrative database, collection over months or year, completed based on patient risk or health status, incidence</td>
<td></td>
</tr>
<tr>
<td>Phase 3</td>
<td></td>
</tr>
<tr>
<td>Establishment of a pan-Canadian data base to assess and monitor the burden and extent of chronic wounds in Canada</td>
<td></td>
</tr>
</tbody>
</table>

Clinical Relevance
- Identify the scope of health care organizations that collect prevalence data
- Aid in the creation of a future national wound prevalence survey
- Standardize data collection tools for wound prevalence to be developed
- The network of contributors will be used to seek funding to create a secure national online database that will produce reliable estimates of the prevalence of wounds in the Canadian Healthcare system.
- The project aims to create a national estimate of complex wounds in Canada to aid in policy development by raising awareness of personal and economic burden of complex wounds

Acknowledgment
A heartfelt thank you to Dr. Pamela E. Houghton and Dr. Kimberly LeBlanc for their unwavering support, leadership, mentoring, and kindness.
