

Please explain the biological agents and/or biohazardous substances used and how they will be stored, used and disposed of. Projects without this description will not be reviewed.

Bacillus Calmette-Guerin (BCG) from Attenuated Strain of *Mycobacterium bovis*
BCG will be injected ip into mice in the ACVS Dental Sciences Bldg. These mice will be monitored for the development of diabetes.
BCG will be stored in a secured 4°C fridge in SDRI 224.
All waste, bedding and carcasses will be incinerated. Cages will be chemically treated and autoclave.

Human Source Material

Whole Blood, Synovial Tissue.

The tissue and cells will be handled in a Biological Safety cabinet.
All solid waste will be collected in a biohazard bags and autoclave before disposal.
All liquid waste will be collected and autoclave before disposal.

Synovial Fluid:

The fluid will be handled in a Biological Safety cabinet.
All solid waste will be collected in a biohazard bags and autoclave before disposal.
All liquid waste will be collected and autoclave before disposal.

Rodent Source Material

Liver, Kidney, Lymph Nodes, Spleen, Pancreas, Bone Marrow:

Whole cell will be extracted from these tissues and used in cell cultures experiments and adoptive transfer into mice.

Only Fresh tissues will be used. The cells will be handled in a Biological Safety cabinet.
All solid waste will be collected in a biohazard bags and autoclave before disposal.
All liquid waste will be collected and autoclave before disposal.
All mice that received adoptive cells will be housed at ACVS. All waste, bedding and carcasses will be incinerated. Cages will be autoclave.

Biological Toxins

Staphylococcal Enterotoxin B:

Staphylococcus enterotoxin B (SEB) is a bacterial superantigen that binds to MHC class II outside the conventional peptide antigen-binding site. We will be using SEB to determine the competitive binding pattern of Insulin peptide (autoantigen peptide) to MHC class II, which determine the outcome of the immune response leading to autoimmune disorders such as insulin dependent diabetes mellitus (IDDM).
Spleen cells from unimmunized NOD and BALB/c mice will be incubated with various FITC-labeled peptides (Insulin, OVA, CLIP), then washed and incubated with various concentrations of SEB for 1 hour on ice. The binding of FITC-labeled peptides will be measured using flow cytometry.
Staphylococcus enterotoxin B will be stored in a secured 4°C fridge in SDRI 224.
All waste will be collected and stored in biohazard waste bags and autoclave before disposal.

Pertussis Toxin:

Experimental autoimmune encephalomyelitis (EAE) is a model for investigating interactions of Th17 cells, and their functional role in causing and ameliorating autoimmune disease. Pertussis toxin will be injected ip into mice to weaken the blood brain barrier and facilitate rapid induction of EAE.

Pertussis Toxin will be diluted to 1ng/ml and stored in a secured 4°C fridge in SDRI 224.

All waste, bedding and carcasses will be incinerated. Cages will be chemically treated and autoclave.

Cells Types

U937, PU5, NIT-1, DC-2.4:

These cell types will be used in cell culture experiments incubated at 37°C.

Stock supply stored in -80°C freezer or Liquid Nitrogen

All solid waste will be collected in a biohazard bags and autoclave before disposal.

All liquid waste will be collected and autoclave before disposal.

DH5 α from E.coli will be used in bacterial cloning.

Stock supply stored in -20°C freezer otherwise stored in a 4°C fridge

All waste will be collected and stored in biohazard waste bags and autoclave before disposal.

Please include a one page research summary or teaching protocol.

There are three major area of our research:

a. Cellular basis for the activation of regulatory CD4+CD25+ and effector Th17 T cells in autoimmunity by microbial agents and autoantigens

Regulatory T cells modulate both immunity and autoimmunity. We are exploring the role of these cells in the pathogenesis and prevention of type 1 diabetes (T1D). This includes induction of CD4+CD25+ (Treg) cells and Th17 effector cells. There is reciprocal relationship between Treg cells, which prevent tissue inflammation and promote self-tolerance and Th17 cells that are generally proinflammatory. We are investigating novel IL-17-producing Th17 cell subsets and elucidating the role of proinflammatory cytokines following mycobacterial immunization or after treatment with autoantigens and peptides of autoantigens such as insulin. Our protocol involves using NOD mouse model of T1D and related mouse strains. In some studies peripheral blood cells from diabetic or control non-diabetic subjects may be used in collaborative studies

b. Dendritic cell mediated regulation of T cell mediated autoimmunity in Type I diabetes

Induction and progression of T cell mediated autoimmune diseases such as Type 1 diabetes (T1D) is dependent on antigen presenting cells particularly dendritic cells (DC). Different subsets of DC are critical in the induction and effector phase of the disease. The goal of this project is to use DC in preventing and modulating T1D using animal models. Further, to correlate the data from the mouse model of T1D with human patients, we assess blood DC from subjects with T1D. Additionally, our lab has discovered a novel peptide fragment of apolipoprotein E (ApoE), termed Ep1.B, which induces the differentiation of monocytes into a disease protective DC subset. We also explore mechanisms and disease prevention strategies using regulatory T cell subsets and autoantigens involved in disease. Our protocol involves using NOD mouse model of T1D and related mouse strains. In some studies peripheral blood cells from diabetic or control non-diabetic subjects may be used in collaborative studies

c. Modulation of islet beta cell expansion in pancreatic tissue

There is considerable evidence that insulin producing beta cells in the pancreatic islets these cells can regenerate through formation of new islet-like cell clusters containing beta cells. We previously showed diabetes prevention and islet preservation in NOD mice by treatment with mycobacterail preparations such as complete Freund's adjuvant (CFA) or BCG. Several recent studies have confirmed regeneration of beta cells in the islets and following blocking of autoimmunity. The specific aims of our work is to investigate the expression of various transcription factors of *Reg* family involved in islet beta cell regeneration in pancreas of NOD mice and functionally characterize these cells. The potential regeneration of beta cell regeneration is being investigated to reverse T1D.

1.0 Microorganisms

1.1 Does your work involve the use of biological agents? YES NO
 (non-pathogenic and pathogenic biological agents including but not limited to bacteria and other microorganisms, viruses, prions, parasites or pathogens of plant or animal origin)? If no, please proceed to Section 2.0

Do you use microorganisms that require a permit from the CFIA? YES NO

If YES, please give the name of the species. _____

What is the origin of the microorganism(s)? DH5 α from E.coli
BCG from Attenuated Strain of Mycobacterium bovis

Please describe the risk (if any) of escape and how this will be mitigated: _____

There is no risk concerning DH5 α . Surface will be clean and sterilize with 70% ethanol.

There is on risk concerning BCG. This is an Attenuated (dead) extract. Spills will be clean up with a 10% Bleach solution.

Please attach the CFIA permit.

Please describe any CFIA permit conditions:

1.2 Please complete the table below:

Name of Biological agent(s)*	Is it known to be a human pathogen? YES/NO	Is it known to be an animal pathogen? YES/NO	Is it known to be a zoonotic agent? YES/NO	Maximum quantity to be cultured at one time? (in Litres)	Source/ Supplier	PHAC or CFIA Containment Level
E.coli-DH5 α	<input type="radio"/> Yes <input checked="" type="radio"/> No	<input type="radio"/> Yes <input checked="" type="radio"/> No	<input type="radio"/> Yes <input checked="" type="radio"/> No	500mls	Gibco/ Invitrogen	<input checked="" type="radio"/> 1 <input type="radio"/> 2 <input type="radio"/> 2+ <input type="radio"/> 3
Bacillus Calmette-Guerin	<input type="radio"/> Yes <input checked="" type="radio"/> No	<input type="radio"/> Yes <input checked="" type="radio"/> No	<input type="radio"/> Yes <input checked="" type="radio"/> No	0.2 ml	Sanofi Pasture	<input type="radio"/> 1 <input type="radio"/> 2 <input checked="" type="radio"/> 2+ <input type="radio"/> 3

*Please attach a Material Safety Data Sheet or equivalent from the supplier.

2.0 Cell Culture

2.1 Does your work involve the use of cell cultures? YES NO

If no, please proceed to Section 3.0

2.2 Please indicate the type of primary cells (i.e. derived from fresh tissue) that will be grown in culture:

Cell Type	Is this cell type used in your work?	Source of Primary Cell Culture Tissue	AUS Protocol Number
Human	<input checked="" type="radio"/> Yes <input type="radio"/> No	Blood	Not applicable
Rodent	<input checked="" type="radio"/> Yes <input type="radio"/> No	Liver, Kidney, Lymph Nodes, Spleen,	2008-005 Singh

		Pancreas, Boon Marrow	
Non-human primate	<input type="radio"/> Yes <input checked="" type="radio"/> No		

2.3 Please indicate the type of established cells that will be grown in culture in:

Cell Type	Is this cell type used in your work?	Specific cell line(s)*	Supplier / Source
Human	X Yes O No	U937	ATCC
Rodent	X Yes O No	PU5, NIT-1, DC-2.4	ATCC
Non-human primate	O Yes X No		
Other (specify)	O Yes O No		

*Please attach a Material Safety Data Sheet or equivalent from the supplier. (For more information, see www.atcc.org)

2.4 For above named cell types(s) indicate PHAC or CFIA containment level required O 1 X 2 O 2+ O 3

3.0 Use of Human Source Materials

3.1 Does your work involve the use of human source materials? X YES O NO
If no, please proceed to Section 4.0

3.2 Indicate in the table below the Human Source Material to be used.

Human Source Material	Source/Supplier /Company Name	Is Human Source Material Infected With An Infectious Agent? YES/NO	Name of Infectious Agent (If applicable)	PHAC or CFIA Containment Level (Select one)
Human Blood (whole) or other Body Fluid	Whole Blood, Synovial Fluid. LHSC-UH /Canadian Blood Services	O Yes X No O Unknown		O 1 X 2 O 2+ O 3
Human Blood (fraction) or other Body Fluid	Serum, Cells. LHSC-UH	O Yes X No O Unknown		O 1 X 2 O 2+ O 3
Human Organs or Tissues (unpreserved)	Synovial Tissue. LHSC-UH	O Yes X No O Unknown		O 1 X 2 O 2+ O 3
Human Organs or Tissues (preserved)		Not Applicable		Not Applicable

4.0 Genetically Modified Organisms and Cell lines

4.1 Will genetic modifications be made to the microorganisms, biological agents, or cells described in Sections 1.0 and 2.0? X YES O NO If no, please proceed to Section 5.0

4.2 Will genetic modification(s) involving plasmids be done? O YES, complete table below X NO

Bacteria Used for Cloning *	Plasmid(s) **	Source of Plasmid	Gene Transfected	Describe the change that results from transformation or transfection
E.coli-DH5 α	pGEMEX-1	Promega	Mouse GAD	This mGAD/pGEMEX plasmid with its T7 gene 10 protein expression can now express mouse GAD recombinant protein.

* Please attach a Material Data Sheet or equivalent if available.

** Please attach a plasmid map.

4.3 Will genetic modification(s) involving viral vectors be made? YES, complete table below NO

Virus Used for Vector Construction	Vector(s) *	Source of Vector	Gene(s) Transduced	Describe the change that results from transduction

* Please attach a Material Safety Data Sheet or equivalent.

4.4 Will genetic sequences from the following be involved?

- ◆ HIV YES, please specify _____ NO
- ◆ HTLV 1 or 2 or genes from any Level 1 or Level 2 pathogens YES, specify _____ NO
- ◆ SV 40 Large T antigen (NIT-cells) YES NO
- ◆ E1A oncogene YES NO
- ◆ Known oncogenes YES, please specify _____ NO
- ◆ Other human or animal pathogen and or their toxins YES, please specify _____ NO

4.5 Will virus be replication defective? YES NO

4.6 Will virus be infectious to humans or animals? YES NO

4.7 Will this be expected to increase the containment level required? YES NO

5.0 Human Gene Therapy Trials

5.1 Will human clinical trials be conducted involving a biological agent? YES NO
 (including but not limited to microorganisms, viruses, prions, parasites or pathogens of plant or animal origin)
 If no, please proceed to Section 6.0

5.2 If YES, please specify which biological agent will be used: _____
 Please attach a full description of the biological agent.

5.2 Will the biological agent be able to replicate in the host? YES NO

5.3 How will the biological agent be administered? _____

5.4 Please give the Health Care Facility where the clinical trial will be conducted: _____

5.5 Has human ethics approval been obtained? YES, number: _____ NO PENDING

6.0 Animal Experiments

6.1 Will live animals be used? YES NO If no, please proceed to section 7.0

6.2 Name of animal species to be used Mice, Rabbits, Rats.

6.3 AUS protocol # 2008-005 SINGH

6.4 Will any of the agents listed in section 4.0 be used in live animals YES, specify: Adoptive Transfer NO

6.5 Will the agent(s) be shed by the animal: YES NO, please justify:

7.0 Use of Animal species with Zoonotic Hazards

7.1 Will any animals with zoonotic hazards or their organs, tissues, lavages or other body fluids including blood be used (see list below)? YES No If no, please proceed to section 8.0

7.2 Please specify the animal(s) used:

- ◆ Pound source dogs YES NO
- ◆ Pound source cats YES NO
- ◆ Cattle, sheep or goats YES, please specify species _____ NO
- ◆ Non-human primates YES, please specify species _____ NO
- ◆ Wild caught animals YES, please specify species & colony # _____ NO
- ◆ Birds YES, please specify species _____ NO
- ◆ Others (wild or domestic) YES, please specify _____ NO

8.0 Biological Toxins

8.1 Will toxins of biological origin be used? YES NO If no, please proceed to Section 9.0

8.2 If YES, please name the toxin(s) Staphylococcal Enterotoxin B, Pertussis Toxin
Please attach information, such as a Material Safety Data Sheet, for the toxin(s) used.

8.3 What is the LD₅₀ (specify species) of the toxin Staphylococcal Enterotoxin B : 0.014ug/kg
Pertussis Toxin: Intravenous-Rat 0.114 mg/kg.

8.4 How much of the toxin is handled at one time*? Pertussis Toxin : 4 µg per Experiment.
Staphylococcal Enterotoxin B:

Number of mice per experiment: 10-20

Average weight per moues: 20g (0.02kg)

Total Staphylococcal Enterotoxin B handled per experiment: 3-6 ng

8.5 How much of the toxin is stored*? Staphylococcal Enterotoxin B: 5mg
Pertussis Toxin: 50 µg

8.6 Will any biological toxins be used in live animals? YES, Please provide details: See Attach Experimental Description Attach. NO

*For information on biosecurity requirements, please see:
<http://www.uwo.ca/humanresources/docandform/docs/health>

See Toxin
Calculations

9.0 Insects

9.1 Do you use insects? YES NO If no, please proceed to Section 10.0

9.2 If YES, please give the name of the species. _____

9.3 What is the origin of the insect? _____

9.4 What is the life stage of the insect? _____

9.5 What is your intention? Initiate and maintain colony, give location: _____
 "One-time" use, give location: _____

9.6 Please describe the risk (if any) of escape and how this will be mitigated:

13.0 Containment Levels

13.1 For the work described in sections 1.0 to 9.0, please indicate the highest HC or CFIA Containment Level required. 1 2 2+ 3

13.2 Has the facility been certified by OHS for this level of containment?
 YES, permit # if on-campus BIO-UWO-0066
 NO, please certify
 NOT REQUIRED for Level 1 containment

14.0 Procedures to be Followed

14.1 As the Principal Investigator, I will ensure that this project will follow the Western Biosafety Guidelines and Procedures Manual for Containment Level 1 & 2 Laboratories (and the Level 3 Facilities Manual for Level 3 projects). I will ensure that UWO faculty, staff and students working in my laboratory have an up-to-date Hazard Communication Form, found at <http://www.wph.uwo.ca/>

SIGNATURE Bhupinder Singh Date: Nov. 5 2010

14.2 Please describe additional risk reduction measures will be taken beyond containment level 1, 2, 2+ or 3 measures, that are unique to this agent.
No additional measures are required for these agents.

14.3 Please outline what will be done if there is an exposure to the biological agents listed, such as a needlestick injury:
The person will receive immediate medical attention

15.0 Approvals

1) UWO Biohazards Subcommittee: SIGNATURE: _____
Date: _____

2) Safety Officer for the University of Western Ontario
SIGNATURE: _____
Date: _____

3) Safety Officer for Institution where experiments will take place (if not UWO):
SIGNATURE: _____
Date: _____

Approval Number: _____ Expiry Date (3 years from Approval): _____

Special Conditions of Approval:

? Pertussis vaccine

New Info

Friday, November 05, 2010

Biohazards Subcommittee issues:

Q1. The amount of Staphylococcal enterotoxin B used (100-500 µg) is more than one lethal dose (0.014 µg). - do you need to use this amount??? can you use less at one time???

Reply 1. Will amend protocol.

Line 8.3 LD₅₀ (specify species) of the toxin:

Staphylococcal Enterotoxin B : 0.014ug/kg

Line 8.4 How much of the toxin is handled at one time*?

Staphylococcal Enterotoxin B

Number of mice used per experiment : 10-20

Average weight per mouse: 20g (0.02kg)

Total Staphylococcal Enterotoxin B handled per experiment : 3-6 ng

Q2. The full names of the biological agents (for example, BCG) need to be used.

Reply 2: Amend "BCG" to full name on page 5 section 1.2

Ed Lee-Chan

Specific effects

Carcinogenic effects	No information available
Mutagenic effects	No information available
Reproductive toxicity	No information available
Sensitization	No information available

Target Organ Effects Eyes. Skin.

4. FIRST AID MEASURES

Skin contact	Wash off immediately with plenty of water
Eye contact	Rinse thoroughly with plenty of water, also under the eyelids.
Ingestion	Never give anything by mouth to an unconscious person
Inhalation	Move to fresh air
Notes to physician	Treat symptomatically

5. FIRE-FIGHTING MEASURES

Suitable extinguishing media	Dry chemical
Special protective equipment for firefighters	Wear self-contained breathing apparatus and protective suit

6. ACCIDENTAL RELEASE MEASURES

Personal precautions	Use personal protective equipment
Methods for cleaning up	Soak up with inert absorbent material

7. HANDLING AND STORAGE

Handling	Avoid contact with skin and eyes.
Storage	Keep in properly labelled containers

8. EXPOSURE CONTROLS / PERSONAL PROTECTION

Occupational exposure controls

Exposure limits

Chemical Name	OSHA PEL (TWA)	OSHA PEL (Ceiling)	ACGIH OEL (TWA)	ACGIH OEL (STEL)
dimethylsulfoxide	-	-	-	-

Engineering measures Ensure adequate ventilation, especially in confined areas

Personal protective equipment

Respiratory protection	In case of insufficient ventilation wear suitable respiratory equipment
Hand protection	Protective gloves
Eye protection	Safety glasses with side-shields
Skin and body protection	Lightweight protective clothing
Hygiene measures	Handle in accordance with good industrial hygiene and safety practice
Environmental exposure controls	Prevent product from entering drains

9. PHYSICAL AND CHEMICAL PROPERTIES

General Information

Form Liquid

Important Health Safety and Environmental Information

Boiling point/range	°C 189	°F No data available
Melting point/range	°C 18.4	°F No data available
Flash point	°C 94	°F No data available
Autoignition temperature	°C No data available	°F No data available
Oxidizing properties	No information available	
Water solubility	soluble	

10. STABILITY AND REACTIVITY

Stability	Stable under normal conditions.
Materials to avoid	No information available
Hazardous decomposition products	No information available
Polymerization	Hazardous polymerisation does not occur

11. TOXICOLOGICAL INFORMATION

Acute toxicity

Chemical Name	LD50 (oral, rat/mouse)	LD50 (dermal, rat/rabbit)	LC50 (Inhalation, rat/mouse)
dimethylsulfoxide	14500 mg/kg (Rat)	No data available	No data available

Principle Routes of Exposure/

Potential Health effects

Eyes	Irritating to eyes.
Skin	Irritating to skin. Components of the product may be absorbed into the body through the skin.
Inhalation	May cause irritation of respiratory tract.
Ingestion	May be harmful if swallowed.

Specific effects

Carcinogenic effects	No information available
Mutagenic effects	No information available
Reproductive toxicity	No information available
Sensitization	No information available

Target Organ Effects

Eyes. Skin.

12. ECOLOGICAL INFORMATION

Ecotoxicity effects	No information available.
Mobility	No information available.
Biodegradation	Inherently biodegradable.
Bioaccumulation	Does not bioaccumulate.

13. DISPOSAL CONSIDERATIONS

Dispose of in accordance with local regulations

ImmuCyst®

Bacillus Calmette-Guérin (BCG), substrain Connaught

PART I: HEALTH PROFESSIONAL INFORMATION

SUMMARY PRODUCT INFORMATION

Route of Administration	Dosage Form / Strength	Clinically Relevant Non-medicinal Ingredients
Intravesical Instillation	Powder for suspension: 81 mg (dry weight) equivalent to $10.5 \pm 8.7 \times 10^8$ colony forming units (CFU)	Monosodium glutamate <i>For a complete listing see DOSAGE FORMS, COMPOSITION AND PACKAGING</i>

DESCRIPTION

ImmuCyst® [Bacillus Calmette-Guérin (BCG), substrain Connaught] is a freeze-dried preparation made from the Connaught substrain of Bacillus Calmette-Guérin, which is an attenuated strain of *Mycobacterium bovis* for treatment of non-muscle invasive bladder cancer (Ta/T1 papillary tumours and CIS). (1)

The BCG organisms are viable upon reconstitution. The reconstituted product contains $10.5 \pm 8.7 \times 10^8$ colony-forming units (CFU) per instillation dose.

INDICATIONS AND CLINICAL USE

ImmuCyst® is indicated for intravesical use in the treatment of primary or recurrent carcinoma *in situ* (CIS) of the urinary bladder, for prophylaxis of recurrence of CIS of the urinary bladder and for prophylaxis following transurethral resection (TUR) of primary or recurrent stage Ta and/or T1 papillary tumours, or any combination thereof, regardless of antecedent intravesical treatment. (1)

ImmuCyst® is not indicated as an immunizing agent for the prevention of tuberculosis. (1)

CONTRAINDICATIONS

- Known systemic hypersensitivity reaction to any component (see DESCRIPTION and WARNINGS AND PRECAUTIONS) of ImmuCyst® or after previous administration of the medicinal product or a medicinal product containing the same substances.
- Active tuberculosis. Active tuberculosis should be ruled out before starting treatment with ImmuCyst®.
- Current symptoms or previous history of systemic BCG reaction. (See WARNINGS AND PRECAUTIONS.)
- Concurrent febrile illness, urinary tract infection, or gross hematuria. Treatment with ImmuCyst® should be postponed until their resolution. (See WARNINGS AND PRECAUTIONS, Serious and Severe Adverse Events Related Precautions.)
- Congenital or acquired immune deficiencies, whether due to concurrent disease (e.g., AIDS, leukemia and lymphoma) or immunosuppressive therapy (e.g., corticosteroids, cancer therapy [cytotoxic drugs, radiation]) (see DRUG INTERACTIONS, Drug-Drug Interactions) because of the risk of disseminated BCG infection.
- A minimum of 14 days should elapse before ImmuCyst® is administered following biopsy, TUR or traumatic catheterization. (2)

WARNINGS AND PRECAUTIONS

Serious Warnings and Precautions

Systemic BCG Reactions

A systemic BCG reaction, which may be fatal, is a systemic granulomatous illness, which may occur (although rarely) subsequent to exposure to BCG.

Because it is usually difficult to isolate BCG organisms from affected organs, it is often unclear to what extent such a reaction is caused by an infectious process versus an inflammatory hypersensitivity reaction, hence the term "systemic BCG reaction".

Based on past clinical experience with intravesical BCG, "systemic BCG reaction" may be defined as the presence of any of the following signs, if no other etiologies for such signs are detectable: fever $\geq 39.5^{\circ}\text{C}$ for 12 hours; fever $\geq 38.5^{\circ}\text{C}$ for 48 hours; pneumonitis; hepatitis; other organ dysfunction outside of the genitourinary tract with granulomatous inflammation on biopsy; or the classical signs of sepsis, including circulatory collapse, acute respiratory distress and disseminated intravascular coagulation. (3) (See ADVERSE REACTIONS.)

Although rare, a systemic BCG reaction is much more likely to occur if ImmuCyst® is administered within 14 days of biopsy, TUR or traumatic bladder catheterization (associated with hematuria).

General

For intravesical instillation only. Do not inject subcutaneously, intradermally or intravenously.

Advice for Patients

Fever, chills, malaise, flu-like symptoms, increased fatigue or an increase in urinary symptoms, (such as burning or pain on urination) can occur. However, patients should be advised to notify their physicians if any of these symptoms last more than 48 hours or increase in severity. Patients should also notify their physicians if they experience any of the following: an increase in urinary symptoms (such as urgency, frequency of urination, blood in urine), joint pain, eye complaints (such as pain, irritation or redness), cough, skin rash, jaundice, nausea or vomiting.

Because ImmuCyst® contains live mycobacteria, excreted urine may also contain live bacteria. Patients should be advised on appropriate infection control procedures to protect family and close contacts from infection. Patients living with or in close quarters to persons who are immunocompromised (on chemotherapy, etc.) should exercise special caution to avoid inadvertently transmitting BCG infection to such susceptible persons. ImmuCyst® is retained in the bladder for as long as possible up to 2 hours and then voided. To avoid transmission of BCG to others, for 6 hours after treatment patients should void while seated to avoid splashing of urine. Urine voided during this time should be disinfected with an equal volume of household bleach for 15 minutes before flushing or disposal. Unless medically contraindicated, patients should be instructed to increase fluid intake to "flush" the bladder for several hours following treatment with ImmuCyst®. Patients may experience burning with the first void after treatment.

Handling Precautions

Handle as infectious. ImmuCyst® contains live attenuated mycobacteria and should be prepared and handled using aseptic technique. (See DOSAGE AND ADMINISTRATION, Reconstitution of Freeze-Dried Product.) BCG infections have been reported in health-care workers preparing BCG for administration.

Nosocomial infections have been reported in immunosuppressed patients receiving parenteral drugs, which were prepared in areas in which BCG was prepared. (4) (5)

Carcinogenesis and Mutagenesis

Mutagenesis and carcinogenesis studies have not been conducted with ImmuCyst® in animals or in humans. Results from clinical trials do not indicate any increased potential for mutagenesis or carcinogenesis although that was not specifically monitored.

Cardiovascular

The risk of ectopic BCG infections has not been determined but is considered to be very small. BCG infection of aneurysms, arterial grafts and cardiac devices can also occur. The benefits of BCG therapy must be carefully weighed against the possibility of ectopic BCG infection in patients with arterial aneurysms or prosthetic devices of any kind.

Genitourinary

Some male genitourinary tract infections (orchitis/epididymitis) have been refractory to multiple drug antimycobacterial therapy and required orchiectomy.

If a bacterial urinary tract infection (UTI) occurs during the course of ImmuCyst® treatment, ImmuCyst® instillation should be withheld until complete resolution of the bacterial UTI, since the combination of a UTI and BCG-induced cystitis may lead to more severe adverse effects on the genitourinary tract; moreover, because BCG bacilli are sensitive to a wide variety of antibiotics; (6) antimicrobial administration may diminish the efficacy of ImmuCyst®.

Hypersensitivity

Acute allergic reaction has been very rarely reported following intradermal injection of BCG vaccine for the prevention of tuberculosis and therefore should be taken into consideration when administering ImmuCyst®.

The stopper of the vial for this product contains natural latex rubber, which may cause allergic reactions.

Immune

For patients with a condition that may in the future require mandatory immunosuppression (e.g., awaiting organ transplant, myasthenia gravis) the decision to treat with ImmuCyst® should be considered carefully.

Treatments using immunosuppressants and/or radiation interfere with the immune response to ImmuCyst® and increase the risk of disseminated BCG infection. (2)

Because of the risk of BCG infection, ImmuCyst® should not be used in immunosuppressed patients or persons with congenital or acquired immune deficiencies, whether due to concurrent disease (e.g., AIDS, leukemia, lymphoma), cancer therapy (e.g., cytotoxic drugs, radiation), or immunosuppressive therapy (e.g., corticosteroids).

Intravesical treatment with ImmuCyst® may induce a positive response to purified protein derivative (PPD). (See DRUG INTERACTIONS.) Determination of a patient's reactivity to PPD should be conducted before administration of ImmuCyst®.

ImmuCyst® should not be handled by persons with an immunologic deficiency.

Peri-operative Considerations

A minimum of 14 days should elapse before ImmuCyst® is administered following biopsy, TUR or traumatic catheterization. There should be no evidence of hematuria prior to instillation of ImmuCyst®.

Sensitivity/Resistance

ImmuCyst® is not sensitive to pyrazinamide. (7)

Serious and Severe Adverse Events Related Precautions

To prevent serious infections, avoid trauma and/or introduction of contaminants to the urinary tract, a minimum of 14 days should elapse before ImmuCyst® is administered following traumatic catheterization. (See CONTRAINDICATIONS.) The treatment schedule should subsequently be resumed as if no interruption in treatment had occurred.

Patients should be monitored for the presence of symptoms and signs of toxicity after each intravesical treatment. If a patient develops persistent fever or experiences an acute febrile illness consistent with BCG infection, BCG instillations should be permanently discontinued, the patient immediately evaluated and treated for BCG infection and an infectious diseases consultation sought. (See CONTRAINDICATIONS.) As standard therapy for BCG infection, treatment with two or more antimycobacterial agents must be initiated promptly while diagnostic evaluation, including cultures, is conducted. Use of single antibiotic therapy is not recommended. Negative cultures do not necessarily rule out infection.

Special Populations

ImmuCyst® is not recommended for prophylactic treatment following TUR of stage TaG1 papillary tumours unless they are judged to be at high risk of tumour recurrence.

In patients with small bladder capacity, increased risk of bladder contracture should be considered in decisions to treat with ImmuCyst®.

Patients undergoing antimicrobial therapy for other infections should be evaluated to assess whether the therapy might diminish the efficacy of ImmuCyst®. (See DRUG INTERACTIONS, Drug-Drug Interactions.)

Pregnant Women

Animal reproduction studies have not been conducted with ImmuCyst®. It is also not known whether ImmuCyst® can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. ImmuCyst® should be given to a pregnant woman only if clearly needed. Women should be advised not to become pregnant while on therapy. (1)

Nursing Women

It is not known whether ImmuCyst® can be excreted in human milk. Because many medicinal products are excreted in human milk and because of the potential for serious adverse reactions from ImmuCyst® in nursing infants, it is advisable to discontinue breastfeeding if the mother's condition requires treatment with ImmuCyst®. (1)

Pediatrics

Safety and effectiveness of therapy with ImmuCyst® in pediatric patients has not been established. Therefore, ImmuCyst® should not be used in pediatric patients.

ADVERSE REACTIONS

Adverse event information is derived from clinical trials and worldwide post-marketing experience.

Administration of ImmuCyst® causes an inflammatory response in the bladder and can provoke signs and symptoms of cystitis. (See Table 1 and Table 2.) Such reactions may to some degree be taken as evidence that BCG is evoking the desired response, but careful patient monitoring is required.

Symptoms of bladder irritability are reported in approximately 50% of patients receiving ImmuCyst® and typically begin a few hours after instillation and last 6 - 48 hours. The symptoms are usually seen following the third instillation and tend to increase in severity after each administration. The mechanism of action of the irritative side effects has not been studied, but is most consistent with an immunological

mechanism. There is no evidence that dose reduction or antituberculous drug therapy can prevent or lessen the irritative symptoms of ImmuCyst®. (1) (3)

Clinical Trial Adverse Drug Reactions

Because clinical trials are conducted under very specific conditions the adverse drug reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

Description of Data Sources

The adverse reactions which occurred among recipients of ImmuCyst® during clinical trials SWOG 8216 and SWOG 8507 (see ACTION AND CLINICAL PHARMACOLOGY) are listed in Table 1 and Table 2.

Data are categorized by Medical Dictionary for Regulatory Activities (MedDRA) system organ class and by decreasing frequency.

Table 1: SWOG Study 8216 - Adverse Reactions (n = 112)

Adverse Reaction	Percent of Patients	
	Overall Induction Plus Maintenance	(Grade ≥3) (Total of 11 Instillations)
Infections and Infestations		
Cystitis	29.5%	(0.0%)
Urinary Tract Infection	17.9%	(0.0%)
Pulmonary Infection	2.7%	(0.0%)
Systemic Infection	2.7%	(1.8%)
Infection	0.9%	(0.9%)
Blood and Lymphatic System Disorders		
Anemia	20.5%	(0.0%)

* NR = Not Reported

Data from Post-Marketing Experience

The following additional adverse events have been spontaneously reported during the post-marketing use of ImmuCyst® worldwide. Because these events are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to product exposure. Decisions to include these events in labeling were based on one or more of the following factors: 1) severity of the event, 2) frequency of reporting or 3) strength of causal connection to ImmuCyst®.

Data are categorized by MedDRA system organ class.

Infections and Infestations

BCG Infection (rare): BCG is capable of dissemination when administered by the intravesical route. Serious infections, including sepsis with associated mortality, have been reported. BCG infections have also been reported in eye, lung, liver, bone, bone marrow, kidney, regional lymph nodes, peritoneum, genitourinary tract (orchitis/epididymitis) and prostate (e.g., granulomatous prostatitis).

BCG infection of aneurysms and prosthetic devices (including arterial grafts, cardiac devices and artificial joints) has also been reported. (8) (9)

Joint symptoms (arthritis, arthralgia), ocular symptoms (including conjunctivitis, uveitis, iritis, keratitis, granulomatous choroiretinitis), urinary symptoms (including urethritis), skin rash, alone or in combination (Reiter's syndrome), have been reported following administration of ImmuCyst®. For the reports of Reiter's syndrome, the risk seems to be more elevated among patients who are positive for HLA-B27. (10)

Renal abscess (very rare).

Respiratory, Thoracic and Mediastinal Disorders

Pneumonia, interstitial lung disease.

Skin and Subcutaneous Tissue Disorders

Erythema nodosum.

Renal and Urinary Disorders

Renal failure, pyelonephritis, nephritis (including tubulointerstitial nephritis, interstitial nephritis and glomerulonephritis).

Urinary retention (including bladder tamponade and feeling of residual urine).

General Disorders and Administration Site Conditions

Flu like symptoms (rare).

Investigations (Laboratory Tests)

Abnormal/increased blood creatinine or blood urea nitrogen (BUN).

Physicians, nurses and pharmacists should report any adverse reaction related to the administration of the product to the appropriate health authorities in accordance with local requirements and to the Global Pharmacovigilance Department, Sanofi Pasteur Limited, 1755 Steeles Avenue West, Toronto, ON, M2R 3T4 Canada. 1-888-621-1146 (phone) or 416-667-2435 (fax). The report should include details of the treatment history with ImmuCyst®, relevant medical history, the symptoms and signs of the adverse reaction, the treatment administered for the reaction and the response to such treatment.

DRUG INTERACTIONS

Serious Drug Interactions

Immunosuppressive Treatments

Treatment combinations using immunosuppressants and/or radiation interfere with the immune response to ImmuCyst® and increase the risk of disseminated BCG infection. (See WARNINGS AND PRECAUTIONS.) (2)

Drug-Drug Interactions

Intravesical treatment with ImmuCyst® may induce a positive response to PPD, which may complicate future interpretations of skin test reactions to PPD when used to diagnose suspected mycobacterial infections. Determination of a patient's reactivity to PPD should be conducted before administration of ImmuCyst®.

Antibacterial Drugs

Antimicrobial therapy for other infections may interfere with the effectiveness of ImmuCyst®. (6) Patients undergoing antimicrobial therapy should be evaluated to assess whether the therapy might diminish the efficacy of ImmuCyst®.

Antituberculosis Drugs

Antituberculosis drugs should not be used prophylactically to prevent the local, irritative side effects of ImmuCyst®. There are no data to suggest that the acute, local urinary tract symptoms common with intravesical BCG are due to mycobacterial infection.

ImmuCyst® is not sensitive to pyrazinamide. (7)

DOSAGE AND ADMINISTRATION

Recommended Dose

One dose of ImmuCyst® consists of the intravesical instillation of 81 mg BCG.

Intravesical treatment of the urinary bladder should begin a minimum of 14 days after biopsy or TUR (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS) and consists of induction and maintenance therapy.

- The induction therapy schedule consists of one intravesical instillation of ImmuCyst® each week for 6 weeks for a total of 6 doses.
- Based on clinical studies performed with ImmuCyst®, maintenance therapy following induction is highly recommended. After a 6-week pause, one intravesical dose should be given each week for 1 to 3 weeks. Then, one dose should be given each week for 1 to 3 weeks at 6, 12, 18, 24, 30 and 36 months following the initiation of induction treatment.

Reconstitution of Freeze-Dried Product

The preparation of ImmuCyst® should be done using **aseptic technique**. A separate area for the preparation of the ImmuCyst® suspension is recommended in order to avoid cross contamination. The person responsible for mixing the agent should wear gloves, eye protection, a mask and gown to avoid inhalation of BCG organisms and inadvertent exposure of broken skin to BCG organisms.

When handling and reconstituting ImmuCyst®, care should be taken so as to avoid needle stick injuries.

ImmuCyst® should not be handled by persons with an immunologic deficiency. (See WARNINGS AND PRECAUTIONS.)

Do not remove the rubber stopper from the vial.

Prepare the surface of the ImmuCyst® and diluent (if provided) vials using a suitable antiseptic.

Presentation with diluent: Using a 5 mL sterile syringe and needle, draw into the syringe a volume of air equal to the volume of diluent in the vial. Pierce the center of the rubber stopper in the vial containing diluent with the sterile needle of the syringe, invert the vial and slowly inject into it the air contained in the syringe. Keeping the point of the needle immersed in the diluent, withdraw into the syringe 3.0 mL of

diluent for the 81 mg vial presentation. Then, holding the syringe-plunger steady, withdraw the needle from the vial.

Presentation without diluent: Using a 5 mL sterile syringe and needle, draw up 3 mL of sterile preservative-free saline solution.

For both presentations: Using the same syringe and needle, pierce the rubber stopper in the vial of freeze-dried material with the needle. Hold the vial of freeze-dried material upright and pull the plunger of the syringe back to create a mild vacuum in the vial. Release the plunger and allow the vacuum to pull the saline from the syringe into the vial of freeze-dried material. After all the saline has passed into the freeze-dried material, remove the needle and syringe.

Shake the vial gently until a fine, even suspension results. Avoid foaming since this will prevent withdrawal of the proper dose. Withdraw the entire contents of the reconstituted material from the vial into the same 5 mL syringe. Return the vial to an upright position before removing the syringe from the vial.

Further dilute the reconstituted material from the vial (1 dose) in an additional 50 mL of sterile, preservative-free saline to a final volume of 53 mL for intravesical instillation.

Any reconstituted product which exhibits flocculation or clumping that cannot be dispersed with gentle shaking should not be used.

Administration

For intravesical instillation only. Do not inject subcutaneously or intravenously.

This dose is prepared by reconstituting 1 vial containing 81 mg freeze-dried BCG with 3 mL of diluent or with 3 mL of sterile, preservative-free saline. The reconstituted BCG is further diluted in 50 mL of sterile, preservative-free saline, for a total of 53 mL instillation volume. (See WARNINGS AND PRECAUTIONS and DOSAGE AND ADMINISTRATION, Reconstitution of Freeze-Dried Product.)

A urethral catheter is inserted into the bladder under aseptic conditions, the bladder is drained and then the 53 mL suspension of ImmuCyst® is instilled slowly by gravity, following which the catheter is withdrawn.

The patient retains the suspension for as long as possible up to two hours. The patient should lie prone for the first 15 minutes following instillation. Thereafter, the patient is allowed to be up. At two hours after the instillation, all patients should void in a seated position for hygienic safety reasons. (See WARNINGS AND PRECAUTIONS and SPECIAL HANDLING INSTRUCTIONS.) Unless medically contraindicated, patients should be instructed to increase fluid intake in order to flush the bladder in the hours following BCG treatment.

OVERDOSAGE

Not documented.

ACTION AND CLINICAL PHARMACOLOGY

Pharmacodynamics

When administered intravesically as a cancer therapy, BCG promotes a local acute inflammatory and sub-acute granulomatous reaction with macrophage and leukocyte infiltration in the urothelium and lamina propria of the urinary bladder. (11) (12) The local inflammatory effects are associated with an elimination or reduction of non-muscle invasive cancerous tumours of the urinary bladder (Ta/T1 papillary tumours and CIS). The exact mechanism of action is unknown, but the anti-tumour effect appears to be T-lymphocyte dependent. (12) (13)

Pharmacokinetics

Because ImmuCyst® contains live mycobacteria, excreted urine may also contain live bacteria. (See WARNINGS AND PRECAUTIONS and SPECIAL HANDLING INSTRUCTIONS.)

STORAGE AND STABILITY

ImmuCyst® should be stored at 2° to 8°C (35° to 46°F) (i.e., in a refrigerator). It should not be used after the expiration date marked on the vial, otherwise it may be inactive.

At no time should the freeze-dried ImmuCyst® be exposed to direct or indirect sunlight. Exposure to artificial light should also be kept to a minimum.

Reconstituted Product

Once reconstituted, the product should be used immediately.

Reconstituted product should not be exposed to direct or indirect sunlight. Exposure to artificial light should also be kept to a minimum.

If there is an unavoidable delay between reconstitution and administration, this delay should not exceed 2 hours at a temperature between 2° to 25°C (35° to 77°F).

Any reconstituted product, which exhibits flocculation or clumping that cannot be dispersed with gentle shaking, should not be used.

SPECIAL HANDLING INSTRUCTIONS

Instructions for Disposal

Unused product, packaging and all equipment and materials used for instillation of the product (e.g., syringes, catheters) should be placed immediately in a container for biohazardous materials and disposed of according to local requirements applicable to biohazardous materials.

Urine voided during the 6-hour period following ImmuCyst® instillation should be disinfected with an equal volume of 5% hypochlorite solution (undiluted household bleach) and allowed to stand for 15 minutes before flushing. (See WARNINGS AND PRECAUTIONS.)

DOSAGE FORMS, COMPOSITION AND PACKAGING

Dosage Forms

ImmuCyst® is supplied as a sterile lyophilized white powder in a vial containing 81 mg. If provided, the diluent is a sterile clear colourless solution supplied in a vial containing 3 mL.

Composition

Active Ingredients:

Bacillus Calmette-Guérin (BCG), substrain Connaught 81 mg

Other Ingredients:

Excipient

Monosodium glutamate 150 mg (5% w/v)

Diluent (if provided):

Sodium chloride	25.5 mg (0.85% w/v)
Disodium hydrogen phosphate	7.5 mg (0.25% w/v)
Sodium dihydrogen phosphate	1.7 mg (0.06% w/v)
Polysorbate 80	0.75 mg (0.025% w/v)
Water for injection	up to 3 mL

No preservative is added.

Packaging:

ImmuCyst® is supplied in a package containing either:

- one 81 mg vial of BCG with one 3 mL vial diluent
- one 81 mg vial of BCG

ImmuCyst® is supplied in an amber Type 1 glass vial and the diluent (if provided) is supplied in a clear Type 1 glass vial. The stopper for both vials contains natural latex rubber.

Vaccine Information Service: 1-888-621-1146 or 416-667-2779.

Business Hours: 8 a.m. to 5 p.m. Eastern Time Monday to Friday.

Full product monograph available on request or visit us at www.sanofipasteur.ca

Product information as of January 2010.

PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Product Characteristics

ImmuCyst® [Bacillus Calmette-Guérin (BCG), substrain Connaught] is prepared from a culture of the Connaught strain of Bacillus Calmette-Guérin (BCG), which is an attenuated strain of living bovine tubercle bacillus, *Mycobacterium bovis*. The bacilli are lyophilized and are viable upon reconstitution.

The reconstituted product contains $10.5 \pm 8.7 \times 10^8$ colony-forming units (CFU) per instillation dose when resuspended. (1)

ImmuCyst® is supplied in a single vial containing 81 mg of BCG with a 3 mL vial of diluent (if provided). The product and the diluent (if provided) contain no preservative. One dose consists of one 81 mg vial of reconstituted material further diluted in 50 mL sterile, preservative-free saline.

CLINICAL TRIALS

Study Demographics and Trial Design

Table 3: Summary of Patient Demographics for Clinical Trials

Study #	Trial design	Dosage, route of administration and duration	Study subjects (n=number)	Mean age (Range)	Gender
SWOG 8216	Randomized	81 mg intravesically	127	65-68	male
SWOG 8507	Randomized	81 mg intravesically	389	62-73	male & female

Clinical studies have proven the effectiveness of ImmuCyst® for patients with non-muscle invasive bladder cancer at the Carcinoma *in situ* (CIS), Ta and T1 stages, including two multicentre controlled, randomized trials.

In the first study SWOG 8216, ImmuCyst® was compared to doxorubicin hydrochloride (Adriamycin®) among patients with either CIS or recurrent papillary tumours or both. (14) ImmuCyst® was administered intravesically once each week for 6 weeks, with an additional single instillation at 3, 6, 12, 18 and 24 months following the initiation of treatment (total of 11 instillations). Doxorubicin was administered once each week for 5 weeks, with an additional 11 single monthly treatments.

For patients with CIS, the complete response rate (i.e., negative biopsies and urine cytology) within 6 months of the initiation of treatment was 70% with ImmuCyst® versus 34% with doxorubicin ($p < 0.001$); the probability of being disease-free (i.e., having no evidence of bladder cancer) at 5 years was 45% ($n = 64$ patients) and 18% ($n = 67$ patients), respectively ($p < 0.001$ by proportional hazards regression model); and among complete responders, the median time to treatment failure was 39 months versus 5.1 months, respectively. Among patients with papillary tumours (Ta or T1) without CIS, the probability of being disease-free at 5 years was 37% ($n = 63$ patients) with ImmuCyst® versus 17% ($n = 68$ patients) with doxorubicin ($p = 0.015$ by proportional hazards regression model). (14)

In the second study SWOG 8507, two treatment regimens of ImmuCyst® were compared among similar patients to the first study. (15) (16) The initial study report covered a median follow-up period of 3.2 years (1992), (15) and a recent analysis reported a total of ten years of median follow-up data (2000). (16) A 6-

week induction course alone (total of 6 instillations) was compared to a more intensive regimen consisting of the following: an induction course of one treatment each week for 6 weeks; after a 6-week pause, another treatment each week for 3 weeks; and then maintenance therapy consisting of one instillation each week for 3 weeks at 6 months after the initiation of the induction course and then every 6 months for 36 months (total of 27 instillations from the start of therapy).

Comparing the maintenance regimen to the no-maintenance regimen (i.e., 6-week induction course only), the following results were found: the five-year survival was 78% in the no-maintenance compared to 83% in the maintenance arm (p = 0.08).

The overall five-year recurrence free survival was 41% in the no-maintenance group and 60% in the maintenance group (p <0.0001). The recurrence free survival in the 3-week maintenance group (n = 192 patients) was found to be twice as long as (77 versus 36 months) for the no-maintenance group (n = 192 patients). Among a total of 278 eligible patients with CIS, the complete response rate was increased from expected 68% to 84%. The between arm difference for the overall rate of CIS response was significant at p = 0.004. Among the patients with papillary tumours (Ta or T1) without CIS, the median recurrence free survival was 78 months in the maintenance group (n = 128 patients) and 28 months in the no-maintenance group (n = 126 patients).

This study provides evidence that the 3-week, 3-year BCG maintenance schedule provides superior protection from disease recurrence and improves long-term survival. (15) (16)

TABLE 1: COMPARATIVE STUDIES ON EFFICACY OF IMMUCYST®: TREATMENT REGIMENS AND COMPLETE RESPONSE RATES

Treatment Arm	TREATMENT REGIMEN																	RESULTS

PHARMACOLOGY

When administered intravesically as a cancer therapy, BCG promotes a local acute inflammatory and sub-acute granulomatous reaction with macrophage and leukocyte infiltration in the urothelium and lamina

propria of the urinary bladder. (11) (12) The local inflammatory effects are associated with an elimination or reduction of non-muscle invasive cancerous tumours of the urinary bladder (Ta/T1 papillary tumours and CIS). The exact mechanism of action is unknown, but the anti-tumour effect appears to be T-lymphocyte dependent. (12) (13)

General Discussion of BCG Therapy for Bladder Cancer

CIS of the Urinary Bladder

CIS may occur either alone or in association with papillary tumours, particularly those of higher grade. CIS may be multifocal and may be also associated with multifocal pre-malignant dysplastic lesions. While transurethral resection (TUR) is the primary treatment for CIS, it is often not curative: some lesions may be either undetectable or unresectable or both. Furthermore, even with curative TUR, CIS is associated with a high incidence of recurrence and of recurrence of higher-stage lesions, including cancer invasive of the muscle layer of the urinary bladder (stage T2 or higher). Intravesical ImmuCyst® [Bacillus Calmette-Guérin (BCG), substrain Connaught] has been studied and established as both an alternative to radical surgical treatment for CIS and as prophylaxis for recurrence of CIS.

Papillary Tumours of the Urinary Bladder

While TUR is the primary treatment of non-muscle invasive papillary tumours (Ta/T1 tumours), these tumours have a tendency to recur and to progress. This is particularly true when there are two or more co-existing papillary tumours, when there has already been a recurrence of such tumours, or when there is co-existing CIS. In these circumstances, ImmuCyst® has been shown to increase significantly the time to recurrence when administered intravesically for prophylactic purposes following TUR.

TOXICOLOGY

Data from animal studies do not suggest any special hazards other than those already reported from human studies. (1)

Vaccine Information Service: 1-888-621-1146 or 416-667-2779.

Business hours: 8 a.m. to 5 p.m. Eastern Time Monday to Friday.

IMPORTANT: PLEASE READ BEFORE TAKING THIS MEDICATION

PART III: CONSUMER INFORMATION

ImmuCyst®

Bacillus Calmette-Guérin (BCG), substrain Connaught

This leaflet is Part III of a three-part "Product Monograph" published when ImmuCyst® was approved for sale in Canada. It gives Consumers information about ImmuCyst®. Because this is a summary, it does not tell you everything about the medication. Contact your doctor or pharmacist if you have any questions about this product.

ABOUT THIS MEDICATION

What the medication is used for:

ImmuCyst® is used to treat cancerous growths (tumours) on the surface of the bladder. ImmuCyst® also prevents the growth of new tumours.

What it does:

ImmuCyst® works by stimulating your body's immune system to fight against bladder tumours. This form of treatment is called immunotherapy. Research has shown that immunotherapy is a more effective treatment than chemotherapy in fighting the growth of bladder tumours.

When it should not be used:

- If you get a bacterial urinary tract infection (UTI) while you are taking ImmuCyst® or if you have large amounts of blood in your urine, your doctor may stop the treatment.
- The effects of ImmuCyst® on pregnancy are not known. Female patients should use birth control while on ImmuCyst®. Tell your doctor immediately if you think you may be pregnant.
- Women should not breastfeed while on ImmuCyst®.
- Do not use ImmuCyst® if you are allergic to any ingredient in the product.
- People who have active tuberculosis (TB) should not have this treatment.
- People who have any form of immune deficiency should not have this treatment. Immune deficiency may result from diseases (such as AIDS, leukemia and lymphoma) or from treatments that suppress the immune system (such as corticosteroid or cancer therapy that includes cytotoxic drugs or radiation).
- If you have a bladder operation, you should wait a minimum of 14 days before starting to take ImmuCyst®.

What the medicinal ingredient is:

ImmuCyst® is a freeze-dried preparation made from weakened bacteria called *Mycobacterium bovis*. The BCG organisms are alive but weakened.

What the important non-medicinal ingredients are:

Monosodium glutamate: 150 mg

The non-medicinal ingredients of the diluent (if provided) are:

Sodium chloride
Disodium hydrogen phosphate

Sodium dihydrogen phosphate
Polysorbate 80
Sterile water for injection

For a full listing of non-medicinal ingredients see Part 1 of the Product Monograph

What dosage forms it comes in:

Every vial contains 81 mg (dry weight) of BCG powder. The powder must be mixed with saline. A health-care provider will give you the medication through a catheter (a tube) inserted into your bladder.

Serious Warnings and Precautions

Systemic BCG Reactions

A systemic BCG reaction is a general body illness caused by spread of BCG beyond the bladder or an unusual reaction of your body to BCG within your bladder. This reaction is rare but may occur after ImmuCyst® treatment.

Contact your doctor if you have any of the following symptoms, after having an ImmuCyst® treatment:

- fever higher than 39.5°C for 12 hours
- fever higher than 38.5°C for 48 hours
- difficulty breathing
- skin or eyes turning yellow
- unusual bleeding or bruising

WARNINGS AND PRECAUTIONS

Before you use ImmuCyst® talk to your doctor or pharmacist if you:

- have blood in your urine or a urinary tract infection,
- have had a treatment or a disease (such as AIDS) that weakens your immune system,
- have had radiation therapy for cancer,
- are pregnant, breast feeding or intending to become pregnant during therapy,
- have a major medical or surgical procedure scheduled during or shortly after ImmuCyst® treatment,
- have any allergies to the ingredients in ImmuCyst®.

INTERACTIONS WITH THIS MEDICATION

Treatment using immunosuppressants and/or radiation interfere with the body's response to ImmuCyst®. They also increase the risk of side effects from the medication.

Antibiotic therapy used for other infections may interfere with the effectiveness of ImmuCyst®.

Treatment with ImmuCyst® may cause a positive tuberculosis skin test. The results of a skin test for tuberculosis any time after treatment with ImmuCyst® may show that you have tuberculosis even if you don't. If you need a TB skin test, it should be done before you start treatment with ImmuCyst®.

PROPER USE OF THIS MEDICATION

Before Your Treatment

- Tell your doctor about any medications you take regularly. Certain drugs affect how ImmuCyst® works (e.g., some antibiotics, medications that may suppress your bone marrow or immune system and/or radiation).
- Do not drink fluids for at least 2 hours before your treatment so that your bladder will be empty.
- You will have to go to your doctor's office or the hospital for treatment with ImmuCyst®. The treatment does not take a long time, but you should take the day off because of the things you need to do after your treatment.

Things to Know About Your Treatment

When will you have it?

- Your treatment should begin about 2 weeks after biopsy or transurethral resection.
- For the first course of treatment, you will get one dose of ImmuCyst® into your bladder once-a-week for 6 weeks.
- If your doctor prescribes maintenance treatments, you will continue with one dose per week for 3 weeks after six weeks have gone by since you completed your first course of treatment. After six months have passed since you began your first course of treatment, you will have one dose per week for 1 to 3 weeks every 6 months. Your doctor will decide how long you will need maintenance treatment.

What will they do?

- Your doctor or nurse will place a catheter (tube) into your bladder. If there is any urine in your bladder it will be drained through the catheter.
- The doctor or nurse will attach a container of ImmuCyst® solution to the catheter. The solution will run into your bladder. This process is called instillation.
- When all the solution is in your bladder, the catheter will be removed.

What do you have to do?

- Be sure to lie on your stomach for the first 15 minutes after the catheter is removed. After that, you can get up and move around. This will make sure ImmuCyst® has completely covered the inside of your bladder.
- You must hold the ImmuCyst® inside your bladder for as long as possible, up to 2 hours. After 2 hours, you can empty your bladder.

After Your Treatment

- Unless your doctor tells you not to, you should drink lots of liquids for the next 24 hours. Try to drink at least twelve 250 mL (8 oz.) glasses of liquid per day. Urinate frequently.
- Because ImmuCyst® may be infectious, you should disinfect the urine in the toilet before you flush. To do this, pour one cup of pure undiluted bleach into the toilet bowl every time you urinate. Leave bleach in the toilet bowl for 15 minutes before flushing. You should do this every time you urinate for the first 6 hours after treatment.

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

Some people have unpleasant side effects during their treatment with ImmuCyst®. However, the side effects are usually easy to manage. On your treatment days, they may be worse but they will get better in a few days. It is important for you to stay on ImmuCyst® for the whole treatment time. Completing the treatment helps to prevent the tumour from coming back.

Please talk to your doctor about any side effects that you feel may prevent you from finishing the treatment.

The most common side effects include:

- flu-like symptoms: fever, chills, headaches, and muscle aches
- frequent or painful urination
- urination at night
- traces of blood in your urine.

To help you manage these side effects, get plenty of bed rest, drink lots of liquids and take acetaminophen or ASA for any pain and fever. If you are concerned about your symptoms, contact your doctor.

This is not a complete list of side effects. Contact your doctor or pharmacist if you have any unexpected side effects while taking ImmuCyst®.

SERIOUS SIDE EFFECTS, HOW OFTEN THEY HAPPEN AND WHAT TO DO ABOUT THEM

If you experience the following symptoms, contact your doctor or get emergency help immediately:

- any sign of an **ALLERGIC REACTION**, which includes difficulty breathing, shortness of breath, wheezing, rash or hives and/or swelling of the face, or
- any sign of a **BCG INFECTION** which includes cough, high fever for more than 12 hours (greater than 39.5°C) or a fever (greater than 38.5°C) which lasts longer than two days.

If you notice the following symptoms, please see your doctor as soon as possible:

- yellow eyes or skin
- white or grey-coloured stools
- fever with chills, headache, muscle or joint pain that is not relieved by acetaminophen or ASA and lasts for more than 2 days
- severe pain or excessive urinating
- eye problems
- blood in urine

REPORTING SUSPECTED SIDE EFFECTS

To monitor drug safety, Health Canada collects information on serious and unexpected effects of drugs. If you suspect you have had a serious or unexpected reaction to this drug you may notify Health Canada by:
toll-free telephone: 866-234-2345
toll-free fax: 866-678-6789
By email: cadmp@hc-sd.gc.ca

By regular mail:
National AR Centre
Marketed Health Products Safety and Effectiveness
Information Division
Marketed Health Products Directorate
Tunney's Pasture, AL 0701C
Ottawa, ON K1A 0K9

NOTE: Before contacting Health Canada, you should contact your physician or pharmacist.

HOW TO STORE IT

ImmuCyst® should be stored at 2° to 8°C by your health-care provider.

Product Information Sheet	
Permits/Forms:	The original U-937 cell line was established by Dr. K. Nilsson's laboratory in 1974 and he has requested the following: (1) In all papers reporting any use of this cell line or any derivatives thereof a direct reference should be made to Sundstrom and Nilsson (Int. J. Cancer 17: 565-577, 1976). (2) Any proposed commercial use of the cells should be negotiated with Professor Kenneth Nilsson, Rudbeck Laboratory, SE-751 85 Uppsala, Sweden. (3) No distribution of any of the cells or sublines derived therefrom should be made to third parties; (4) The cells should be used for non-clinical, non-commercial research only.

Age:	37 years			
Gender:	male			
Ethnicity:	Caucasian			

The U-937 cell line was derived by Sundstrom and Nilsson in 1974 from malignant cells obtained from the pleural effusion of a patient with histiocytic lymphoma.

Studies since 1979 have shown that U-937 cells can be induced to terminal monocytic differentiation by supernatants from human mixed lymphocyte cultures, phorbol esters, vitamin D3, gamma interferon, tumor necrosis factor (TNF) and, retinoic acid.

The cells are negative for immunoglobulin production and Epstein-Barr virus expression.

The cells express the Fas antigen, and are sensitive to TNF and anti-Fas antibodies.

Comments: In 1994, PCR and cytogenetic analyses showed that a number of stocks of U-937 were contaminated with the human myeloid leukemia cell line, K-562.

In the earliest stocks available, the level of contamination was 0.6%.
[40484]

Distribution was discontinued in March 1994, except if required for patent purposes.

Anyone who wishes to receive a sample of this original material should contact the Head of the ATCC Patent Depository.

A stock of CRL-1593 found to be free of K-562 was propagated continuously for 8 weeks and tested weekly by PCR.

Distribution and seed stocks give DNA profiles characteristic of U-937 only.

Such preparations are now offered as authentic U-937 (ATCC CRL-1593.2) and are believed to be free of second subpopulations.

Propagation: **ATCC complete growth medium:** The base medium for this cell line is ATCC-formulated RPMI-1640 Medium, Catalog No. 30-2001. To make the complete growth medium, add the following components to the base medium: fetal bovine serum to a final concentration of 10%.

Atmosphere: air, 95%; carbon dioxide (CO2), 5%

Temperature: 37.0°C

Protocol: Cultures can be maintained by the addition of fresh medium or replacement of medium. Alternatively, cultures can be established by centrifugation with subsequent resuspension at 1 to 2 X 10⁽⁵⁾ viable cells/ml.

Subculturing: **Interval:** Maintain cell density between 1 X 10⁽⁵⁾ and 2 X 10⁽⁶⁾ viable cells/ml.

Medium Renewal: Add fresh medium every 3 to 4 days (depending on cell density)

Freeze medium: Complete growth medium supplemented with 5% (v/v) DMSO

Preservation: **Storage temperature:** liquid nitrogen vapor phase

Organism:	Mus musculus, transgenic for SV40 large T antigen (mouse, transgenic for SV40 large T antigen)			Technical Support
Morphology:	epithelial			Related Cell Culture Products
Source:	Organ: pancreas Strain: NOD/Lt Tissue: islet of Langerhans Disease: insulinoma Cell Type: beta cell;			
Cellular Products:	insulin			
Permits/Forms:	In addition to the MTA mentioned above, other ATCC and/or regulatory permits may be required for the transfer of this ATCC material. Anyone purchasing ATCC material is ultimately responsible for obtaining the permits. Please click here for information regarding the specific requirements for shipment to your location.			
Applications:	transfection host (Roche FuGENE® Transfection Reagents)			
Antigen Expression:	H-2 g7			
Age:	10 weeks			
Gender:	female			

The NIT-1 cell line was derived from NOD/Lt mice. These mice are transgenic for the SV40 large T antigen under the control of a rat insulin promoter, and spontaneously develop beta adenomas. At passage 18, most cells stained positively for insulin, less than 5% were positive for glucagon and none were positive for somatostatin or pancreatic polypeptide. Insulin secretion is responsive to glucose concentration in the medium. There is low constitutive expression of MHC class I, class II and ICAM-1 mRNA, but expression of both is markedly increased by treatment with interferon gamma. Stimulation of class I mRNA is accompanied by increased class I antigen expression and induction of an occult class I product expressing the H-2.39 specificity. MHC class II antigen is not induced despite the induction of the mRNA. NIT-1 cells show ultrastructural features of differentiated mouse beta cells (well developed rough endoplasmic reticulum, extensive golgi apparatus and beta granules). The cells shed a mature ecotropic type C retrovirus. The retrovirus is capable of infecting other Fv-1 n mouse cell lines, so care should be taken to avoid cross infection. NOTE: NIT-1 cells will not form a confluent monolayer; however, they will form nice colonies of monolayered cells in a fairly dense array. When the NIT-1 colonies begin to ball up slightly and show many round cells on top of the monolayers as well as floating in the media, it is time to passage them.

ATCC complete growth medium: Ham's F12K medium with 2 mM L-glutamine adjusted to contain 1.5 g/L sodium bicarbonate, 90%; heat-inactivated dialyzed fetal bovine serum, 10%.
Temperature: 37.0°C
Atmosphere: air, 95%; carbon dioxide (CO₂), 5%
Subcultivation Ratio: A subcultivation ratio of 1:2 to 1:3 is recommended
Medium Renewal: 1 to 2 times per week

Subcultures are prepared using a cell dissociation buffer (an enzyme free Hanks' based solution; Catalog number: 13150-016 available from GIBCO). Remove the medium from the culture flask, add 2 ml of cell dissociation buffer per 25 sq. cm flask (5 ml per 75 sq. cm. flask and gently rock the flask at room temperature for 1 to 2 minutes to bathe the cells in the buffer. Aspirate the solution and discard. Allow the flask to sit at room temperature for 3 to 4 additional minutes (total time from initial addition of cell dissociation buffer is approximately 5 minutes). Firmly tap the flask against the palm of the hand to dislodge cells. Add 5 ml of fresh medium per 25 sq. cm. flask (10 ml per 75 sq. cm. flask) and triturate up and down directing the stream along the bottom of the flask to dislodge the cells and break up some of the clumps. Add fresh medium, aspirate and dispense into new flasks.

Preservation: Culture medium, 95%; DMSO, 5%

HMIS Classification

Health Hazard: 0
 Chronic Health Hazard: *
 Flammability: 0
 Physical hazards: 0

Potential Health Effects

Inhalation May be harmful if inhaled. May cause respiratory tract irritation.
Skin May be harmful if absorbed through skin. May cause skin irritation.
Eyes May cause eye irritation.
Ingestion May be harmful if swallowed.

4. FIRST AID MEASURES

General advice

Consult a physician. Show this safety data sheet to the doctor in attendance.

If inhaled

If breathed in, move person into fresh air. If not breathing give artificial respiration Consult a physician.

In case of skin contact

Wash off with soap and plenty of water. Consult a physician.

In case of eye contact

Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed

Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

5. FIRE-FIGHTING MEASURES

Flammable properties

Flash point no data available

Ignition temperature no data available

Suitable extinguishing media

Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

Special protective equipment for fire-fighters

Wear self contained breathing apparatus for fire fighting if necessary.

6. ACCIDENTAL RELEASE MEASURES

Personal precautions

Use personal protective equipment. Avoid dust formation. Avoid breathing dust. Ensure adequate ventilation.

Environmental precautions

Do not let product enter drains.

Methods for cleaning up

Pick up and arrange disposal without creating dust. Keep in suitable, closed containers for disposal.

7. HANDLING AND STORAGE

Handling

Avoid formation of dust and aerosols.

Provide appropriate exhaust ventilation at places where dust is formed. Normal measures for preventive fire protection.

Storage

Keep container tightly closed in a dry and well-ventilated place.

Recommended storage temperature: 2 - 8 °C

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Contains no substances with occupational exposure limit values.

Personal protective equipment

Respiratory protection

Where risk assessment shows air-purifying respirators are appropriate use a dust mask type N95 (US) or type P1 (EN 143) respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Hand protection

For prolonged or repeated contact use protective gloves.

Eye protection

Safety glasses with side-shields conforming to EN166

Skin and body protection

Choose body protection according to the amount and concentration of the dangerous substance at the work place.

Hygiene measures

Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance

Form solid

Safety data

pH	no data available
Melting point	no data available
Boiling point	no data available
Flash point	no data available
Ignition temperature	no data available
Lower explosion limit	no data available
Upper explosion limit	no data available
Water solubility	no data available

10. STABILITY AND REACTIVITY

Storage stability

Stable under recommended storage conditions.

Materials to avoid

Strong oxidizing agents

Hazardous decomposition products

Hazardous decomposition products formed under fire conditions. - Nature of decomposition products not known.

11. TOXICOLOGICAL INFORMATION

Acute toxicity

no data available

Irritation and corrosion

no data available

Sensitisation

Prolonged or repeated exposure may cause allergic reactions in certain sensitive individuals.

Chronic exposure

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

Potential Health Effects

Inhalation	May be harmful if inhaled. May cause respiratory tract irritation.
Skin	May be harmful if absorbed through skin. May cause skin irritation.
Eyes	May cause eye irritation.
Ingestion	May be harmful if swallowed.
Target Organs	Small intestine.,

Additional Information

RTECS: XW5807700

12. ECOLOGICAL INFORMATION**Elimination information (persistence and degradability)**

no data available

Ecotoxicity effects

no data available

Further information on ecology

no data available

13. DISPOSAL CONSIDERATIONS**Product**

Observe all federal, state, and local environmental regulations.

Contaminated packaging

Dispose of as unused product.

14. TRANSPORT INFORMATION**DOT (US)**

UN-Number: 3462 Class: 6.1

Packing group: III

Proper shipping name: Toxins, extracted from living sources, solid, n.o.s. (Staphylococcal enterotoxin B

Staphylococcus aureus)

Marine pollutant: No

Poison Inhalation Hazard: No

IMDG

UN-Number: 3462 Class: 6.1

Packing group: III

EMS-No: F-A, S-A

Proper shipping name: TOXINS, EXTRACTED FROM LIVING SOURCES, SOLID, N.O.S. (Staphylococcal

enterotoxin B Staphylococcus aureus)

Marine pollutant: No

IATA

UN-Number: 3462 Class: 6.1

Packing group: III

Proper shipping name: Toxins, extracted from living sources, solid n.o.s. (Staphylococcal enterotoxin B Staphylococcus aureus)

15. REGULATORY INFORMATION**DSL Status**

This product contains the following components that are not on the Canadian DSL nor NDSL lists.

Staphylococcal enterotoxin B Staphylococcus aureus

CAS-No.
11100-45-1**WHMIS Classification**D1B Toxic Material Causing Immediate and Toxic
Serious Toxic Effects**16. OTHER INFORMATION****Further information**

Toxin Calculations

TOXIN USE RISK ASSESSMENT

TOXIN: Staphylococcal Enterotoxin B

PROPOSED USE (DOSE): max 6 ng or 0.006 µg (use)
5 mg or 5000 µg (stored)

LD₅₀ (species): 0.014 µg/kg

CALCULATION:

0.014 ug/kg X 70 kg/person = 0.98 ug per person

Divide by safety factor(s) of 10 (as applicable): 0.098 ug per person

COMMENTS/RECOMMENDATION:

0.098 µg/person > 0.006 µg (use) OK
<< 5000 µg (stored)
∴ problem?

TOXIN USE RISK ASSESSMENT

TOXIN: Pertussis toxin

PROPOSED USE (DOSE): 4 µg (use) or 50 µg (storage)

LD₅₀ (species): 0.114 mg/kg (rat)
 or 114 µg/kg (rat)

CALCULATION:

 114 ug/kg X 70 kg/person = 7980 ug per person

Divide by safety factor(s) of 10 (as applicable): 798 ug per person

COMMENTS/RECOMMENDATION:

798 µg/person >> 4 µg (use) ∴ OK

> 50 µg (storage)

∴ OK
