## 1 Brief Scientific Overview

### 1.1 Project 1

We propose to observe the structural evolution of information processing in networks of rat (and mouse) neurons. Recent work by Bassett et. al. [1] suggests that the underlying connection topology of neural networks is self-similar and scale invariant. While connectivity data can provide loose bounds for information-processing capabilities, it does not address this question directly.

In our initial pilot study we wish to begin to address the question of information-processing capabilities directly through the growth of rat and mouse neurons on Microelectrode Arrays (MEAs). The MEAs will be used to both stimulate, and record, the activity of neurons as they form associations in vitro (for a description of these techniques, see, e.g., [3]). Using stimulation, and recording, sequences suggested by theoretical analysis based on computability theory we intend to characterize the information processing capabilities of the forming neural network over time. It is our hypothesis that the information processing capabilities will increase with time and, moreover, that the resultant functional units will show processing behaviour that reflects the self-similar and scale invariant morphological organization described in [1].

### 1.2 Project 2

We propose to observe the morphology of macronuclear chromosomes in two species of ciliated protozoan using transmission electron microscopy. We will follow a procedure similar to that used in the characterization of the macronuclear chromosome structure of the spirotrichs *Stylonichia pustulata* and *Euplotes aediculatus* [2].

In one of these organisms, *Chilodonella uncinata*, we also wish to carry out DNA and RNA sequencing (with a particular focus on small RNA).
