## HIGHLIGHTS

- Canadian equities endured the same sell-off as other markets in a global flight to safety. Larger capitalization stocks outperformed smaller caps and higher-yielding, defensive names bested cyclicals, driven by low bond yields and heightened investor worries.
- During the latest sell-off, cyclical commodities retreated (e.g. oil, copper), while defensive metals (gold, silver) remained strong. Despite the recent sell-off in base metals and crude oil, prices continue to suggest an economic slowdown rather than a recession. Agricultural commodities such as corn, sold off through this latest downturn, but are higher year-over-year, which should be a positive for continued potash demand.
- Global economic fundamentals are generally better than in the 2008 recession. Strong corporate profits are among the positive drivers; moreover, companies have yet to deploy the record levels of cash on their balance sheets.
- While the Canadian economy has greater ties to the US, our stock market's natural resource bias also links us with positive growth in the developing world. To be sure, the slowdown in developed economies will affect emerging markets, but internal demand and increased domestic consumption will mean economic growth even if exports falter.

The third quarter of 2011 continued the volatility roller coaster on a ride that has now lasted more than three years. The quarter saw markets in a risk-averse mood, with federal government bonds generally the beneficiary: yields on 10-year government bonds in Canada and the US hit record lows. Conversely, substantial equity market losses showed the depth of investor fears.

August opened with the strange political theatre of a Congress-White House standoff over raising the US government's borrowing limits. An

otherwise standard procedure turned into a self-inflicted “crisis” that rapidly eroded confidence in the US legislative process and its ability to deal with a burdensome debt or an unemployment-plagued economy. It also helped incite Standard & Poors to downgrade the quality rating on US government debt.

Europe's own debt issues reemerged into this already-jittery environment, raising fears of a global credit freeze similar to 2008-09. Greece is near default (the market suggests a near certainty of that happening). Viewed in isolation, a default may be the best course of action for that country, since it's extremely difficult, if not unprecedented, for a country to shrink its way out of a debt crisis. The required austerity measures would devastate the Greek economy and GDP growth. However, default has broader ramifications for the European Union as well as the continental banking system. Europe's banks hold about €3 trillion (\$US 4.2 trillion) in sovereign debt: 8% of their total assets.

Nor is the problem limited to Greece. As the world's third-largest bond market, Italy is perhaps an even greater worry. Equally profound are Italy's pledge to cut spending by €54 billion by 2013, and the implications of a default on Italy's \$US 2.1 trillion (\$35,000 per capita) of outstanding debt.

The sovereign debt crisis has now spilled into the real economy, contributing to the slowdown in GDP growth that we are seeing throughout the developed world. The US debt ceiling debate and ensuing rating downgrade also had a chilling effect on consumer confidence. Expectations for US growth came down as a result, with expansion of 1.6% and 2.2% now foreseen for 2011 and 2012, respectively.

Canada has fared somewhat better economically. Even with relatively greater exposure to cyclical industries, GDP growth expectations are still +2.4% for 2011 and +2.2% for 2012. While Canada is in a stronger fiscal position (having battled debt and deficits in the early 1990s), consumers continue to add debt at an alarming pace. The ratio of personal debt to personal disposable income rose to a record 148.7% between July and September. The very high ratio leaves the consumer extremely sensitive to interest rate increases.

The most-recent shift in investor and consumer confidence came from perceived challenges in the macroeconomic backdrop, rather than the concerns about the corporate world that drove the 2008-09 crisis. The greater volatility and higher correlations among

**Stocks move in sync.** Company-specific results meant little in Q3's tight-correlation markets, to the disadvantage of stock-pickers and bottom-up managers. (Sources: S&P, Bloomberg)

**Robert Vanderhooft, CFA Chief Executive & Chief Investment Officer**

equities and equity markets have hurt stock picking, despite better stock-level fundamentals. Correlations are at levels last seen in the 1987 crash, and have muted investors' response to positive news about individual companies. Companies emerged from the recession flush with cash and carrying low debt, yet positive news about earnings, dividends and stock buybacks is generating little enthusiasm among investors. Indeed, even the slightest disappointment provokes a disproportionately negative response from the market.

There is now a greater risk that the global economy will fall back into a recession, given the deteriorating sovereign debt situation in Europe and weak growth in the US. We are likely at or near the tipping point. Within the developed world, austerity measures and deleveraging by consumers and governments alike will mean subdued GDP growth in the near term. Emerging economies are somewhat better positioned, with healthier debt pictures and internal and regional expansion that can keep economies growing. We look to the developing world for economic growth.

When confronted by a year of uncertainty, such as 2011 has become, it is easy to lose a long-term perspective. In the past century, the world has endured disruptions of far greater magnitude than those threatening us today. Yet markets persevered through hyperinflation, system-threatening crises of confidence in the banking system (1907 and 1929), wars, housing bubbles, tech bubbles and a decade-long Great Depression. Each crisis may have temporarily changed investors' behaviour – when and how fast they move in or out of the market – but none of these events fundamentally changed how one builds wealth, or how one finds it. If there is indeed a new normal, it is not one in which a company's demonstrated results versus expectations, competitive advantage and profit growth permanently cease to move markets. Those fundamentals have guided business and investor decisions for millennia, and they will continue to do so.

## COMMENTARY

*Greystone seeks to add value over the long term to its Canadian equity portfolios primarily through bottom-up stock selection following a growth bias. The firm believes that a company's ability to grow its earnings will also enhance the value of its stock.*

- Canadian stocks felt the effects of risk aversion in Q3-2011. Renewed volatility and tight stock correlations hurt stock picking, despite better stock-level fundamentals. We last saw correlations this high in October 1987; they offset positive news about individual companies.
- Canadian banks fared better than the broad market during the latest downturn. Unlike European banks, some of which sold off as much as 50%, Canadian banks have strong balance sheets and capital levels.
- The portfolio disappointed on both a relative and an absolute basis in Q3-2011. Underperformance came from stock-specific factors and from a portfolio tilt towards cyclical stocks versus defensive and yield-oriented names.
- Positive contributions came from gold holdings Eldorado Gold, Goldcorp, Kinross Gold and Semafo. Detractors included Magna, Teck Resources, Finning International and First Quantum Minerals. The absence of defensive and yield-oriented stocks (e.g. BCE, TransCanada, Enbridge) and specific gold names (Barrick, Yamana) also hurt performance. Despite a very small portfolio weight, Sino-Forest also continued to detract.
- We continue to expect a slowdown in economic growth versus a return to a 2008-style recession. Yet given the impact of global macro events on investor confidence, the risks of a double dip have increased. Despite strong corporate fundamentals, volatility will remain high within equity markets that are tied to the resolution of events unfolding in Europe, the US and China. This volatility will be more evident in Canadian equities, given their cyclical bias. Positive drivers for global growth include strong corporate profits, which could help offset weak personal consumption. Companies have yet to deploy record levels of cash to any degree.

## INDEXES & BENCHMARKS

Current benchmark weights and indexes are noted on each asset class page. Benchmark returns reflect any index and weighting changes made since inception. Index returns include reinvestment of dividends, if applicable, but not the deduction of any fees or expenses, which would reduce returns.

Indexes used in Greystone reporting are copyrighted by and used with the permission of their respective providers: Standard & Poors, TMX Inc., Russell Investments, Merrill Lynch & Co. Inc., BMO Capital Markets, Investment Property Databank Limited and its licensors (IPD), and Morgan Stanley Capital International (MSCI). Index use will vary by Greystone client and this report might not cite all indexes or index providers.

*MSCI disclosure:* neither MSCI nor any other party involved in or related to compiling, computing or creating the MSCI data makes any express or implied warranties or representations with respect to such data (or the results to be obtained by the use thereof), and all such parties hereby expressly disclaim all warranties of originality, accuracy, completeness, merchantability or fitness for a particular purpose with respect to any such data. Without limiting any of the foregoing, in no event shall MSCI, any of its affiliates or any third party involved in or related to compiling, computing, or creating the data have any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages. No further distribution or dissemination of the MSCI data is permitted without MSCI's express written consent.

For clients with benchmarks that blend two or more indexes (e.g. DEX 91-day T-Bill 3%, DEX Universe Bond 37%, S&P/TSX Composite 35%, S&P 500 Composite 12.5%, MSCI EAFE (Net) 12.5%): Our reporting system rebalances your benchmark to its stated asset mix on a daily basis. Consequently, there may be discrepancies between benchmark returns presented in this report and those calculated with a monthly or quarterly rebalancing.

For clients who hold fixed income: PC-Bond is the source for credit ratings. If a particular security is not identified by PC-Bond, an equivalent, recognized, independent rating agency is used. Greystone does not rate securities.

For clients who hold real estate: the provider cannot supply IPD returns immediately after quarter-end; therefore, the prior quarter's index return is used in this report for benchmark calculation purposes. When the actual index is available, the benchmark return is then re-calculated.
