A higher encode decode method

Egbert Rijke

April 8th 2021

Overview

- Syllepsis
- Higher encode decode method
- A theorem about $K(\mathbb{Z}/2, n)$

Part 1. Syllepsis

Theorem (The Eckmann-Hilton argument) For any $k \ge 2$ and any pointed type X, the homotopy group

 $\pi_k(X)$

is abelian.

Proof

There are two concatenation operations on paths of paths:

I.e., we have vertical composition $\alpha \bullet \beta$ and horizontal composition $\alpha \circ \gamma$. They satisfy

 $\mathsf{interchange}(\alpha,\beta,\gamma,\delta):((\alpha\bullet\beta)\circ(\gamma\bullet\delta))=((\alpha\circ\gamma)\bullet(\beta\circ\delta))$

Now we can construct an identification

eckmann-hilton(s, t): $s \bullet t = t \bullet s$

for any s, t: refl = refl by the following calculation:

$$s \bullet t = (s \circ \operatorname{refl}) \bullet (\operatorname{refl} \circ t)$$
$$= (s \bullet \operatorname{refl}) \circ (\operatorname{refl} \bullet t)$$
$$= s \circ t$$
$$= (\operatorname{refl} \bullet s) \circ (t \bullet \operatorname{refl})$$
$$= (\operatorname{refl} \circ t) \bullet (s \circ \operatorname{refl})$$
$$= t \bullet s.$$

Syllepsis is an identification

 $\operatorname{eckmann-hilton}(s, t) \bullet \operatorname{eckmann-hilton}(t, s) = \operatorname{refl}$

In order to construct it, we will use the following:

- Three concatenation operations on the third identity type
- A fourth concatenation operation on the fourth identity type
- Unit laws for all of them
- Interchange laws between all of them
- Unit laws for the interchange law
- A coherence law between the three interchange laws
- Simplifications to the special case of Ω^3 .
- Persistence

Kristina Sojakova recently formalized this result in a much more efficient way.

Definition

For any binary operation $f : A \rightarrow B \rightarrow C$ there is a binary action on paths

$$\operatorname{\mathsf{ap-bin}}_f:(x=x') o (y=y') o (f(x,y)=f(x',y')).$$

The binary action on paths induces n concatenation operations on the n-th identity type:

► For any *x*, *y*, *z* : *A* we have

$$- \bullet - : (x = y) \rightarrow (y = z) \rightarrow (x = z).$$

On the third identity type, this gives a concatenation operation

For any x, y, z : A and any p, p' : x = y and q, q' : y = z we have

$$-\circ -:(p=p')
ightarrow (q=q')
ightarrow (pullet q=p'\circ q')$$

On the third identity type, this gives an operation

 On the third identity type, we can now define a third concatenation operation

$$-*-:(\alpha = \alpha') \to (\beta = \beta') \to (\alpha \circ \beta = \alpha' \circ \beta')$$

for any $\alpha, \alpha' : p = p'$, any $\beta, \beta' : q = q'$, p, p' : x = y and q, q' : y = z.

These definitions can be given uniformly by coinduction, using globular types.

We have three interchange laws, one for each pair of operations $\bullet,$ $\circ,$ and *:

For any p, q, r : x = y, any $\alpha, \beta, \gamma : p = q$, any $\delta, \epsilon, \zeta : q = r$, and any $\sigma : \alpha = \beta, \tau : \beta = \gamma, \nu : \delta = \epsilon$, and $\phi : \epsilon = \zeta$, we have an identification

$$(\sigma \bullet \tau) \circ (\nu \bullet \phi) = (\sigma \circ \nu) \bullet (\tau \circ \phi).$$

For any $p, q: x = y, u, v: y = z, \alpha, \beta, \gamma: p = q, \delta, \epsilon, \zeta: u = v, \sigma: \alpha = \beta, \tau: \beta = \gamma, \nu: \delta = \epsilon$, and $\phi: \epsilon = \zeta$, we have an identification

$$(\sigma \bullet \tau) * (\nu \bullet \phi) = (\sigma * \nu) \bullet (\tau * \phi).$$

and an interchange law that states that the square

$$\begin{array}{c} (\alpha \bullet \gamma) \circ (\epsilon \bullet \eta) & \stackrel{\text{interchange}(\alpha, \gamma, \epsilon, \eta)}{=} & (\alpha \circ \epsilon) \bullet (\gamma \circ \eta) \\ (\sigma \circ \tau) * (\nu \circ \phi) \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \nu) \circ (\tau * \phi) \right\| \\ & \left\| (\sigma * \psi$$

commutes.

Lemma

For any $\alpha, \beta, \gamma, \delta, \epsilon, \zeta, \eta, \theta : \Omega^3(X)$, we have a commuting hexagon

$$((\alpha \bullet \beta) \circ (\gamma \bullet \delta)) * ((\epsilon \bullet \zeta) \circ (\eta \bullet \theta))$$

$$((\alpha \bullet \beta) * (\epsilon \bullet \zeta)) \circ ((\gamma \bullet \delta) * (\eta \bullet \theta))$$

$$((\alpha \circ \gamma) \bullet (\beta \circ \delta)) * ((\epsilon \circ \eta) \bullet (\zeta \circ \theta))$$

$$\downarrow$$

$$((\alpha * \epsilon) \bullet (\beta * \zeta)) \circ ((\gamma * \eta) \bullet (\delta * \theta))$$

$$((\alpha * \epsilon) \circ (\gamma * \eta)) \bullet ((\beta * \zeta) \circ (\delta * \theta))$$

Lemma

For any $s, t : \Omega^3(X)$, we have four commuting triangles:

Theorem (Syllepsis) For any $s, t : \Omega^3(X)$, we have

eckmann-hilton(s, t) • eckmann-hilton(t, s) = refl.

Proof.

Part 2. A higher encode decode method

The encode decode method

Theorem (The fundamental theorem of identity types) Consider a type A with base point a : A. Let B be a type family over A equipped with a point b : B(a). Then the following are equivalent:

1. Any family of maps (in particular the canonical family of maps)

 $(a = x) \rightarrow B(x)$

indexed by x : A, is a family of equivalences.

2. The type

$$\sum_{(x:A)} B(x)$$

is contractible.

3. The family B is a (unary) identity system on A.

Theorem

Let X be a pointed type. Let P be a family of (n + 1)-truncated types over $||X||_n$ equipped with a commuting triangle

If f is (n + 1)-connected, then

$$P(\eta(x_0)) \simeq K(\pi_{n+1}(X), n+1).$$

Proof.

The type $\sum_{(x:||X||_n)} P(x)$ is (n + 1)-truncated, so any (n + 1)-connected map into it is an (n + 1)-truncation. Therefore we have

and by the bottom triangle we obtain the fiberwise equivalence that induces

$$P(\eta(x_0)) \simeq K(\pi_{n+1}(X), n+1).$$

The higher encode decode method

To show that $\pi_{n+1}(X) = G$, we can proceed as follows:

1. Define a pointed map

$$P: \|X\|_n \to \sum_{(X:\mathcal{U})} \|K(G, n+1) \simeq X\|$$

2. Construct a commuting triangle

such that f is (n + 1)-connected.

To apply this method in general, we need:

A universal property of η : X → ||X||_n with respect to (n+2)-types. In general, the map

$$(||X||_n \to Y) \to (X \to Y)$$

is 0-truncated, if Y is (n + 2)-truncated.

A dependent universal property of η : X → ||X||_n with respect to (n + 1)-types.

A good handle on the type

$$\mathsf{EM}(G, n) := \sum_{(X:\mathcal{U})} \| K(G, n) \simeq X \|.$$

The first two would be generalisations of results of Kraus. The space EM(G, n) is studied by Scoccola.

Part 3. A theorem about $K(\mathbb{Z}/2, n)$.

Theorem

$$\mathcal{K}(\mathbb{Z}/2, n+1) \simeq \sum_{(X:\mathcal{U})} \|\mathcal{K}(\mathbb{Z}/2, n) \simeq X\|$$

Theorem

$$\mathcal{K}(\mathbb{Z}/2, n+1) \simeq \sum_{(X:\mathcal{U})} \|\mathcal{K}(\mathbb{Z}/2, n) \simeq X\|$$

Lemma (Buchholtz, van Doorn, Rijke) Let $n \ge 1$. For any two groups G and H (required to be both abelian in case $n \ge 2$) there is an equivalence

$$\operatorname{Grp}(G,H) \simeq \sum_{(f:\mathcal{K}(G,n)\to\mathcal{K}(H,n))} f(*) = *.$$

Furthermore, there is an equivalence

$$(G \cong H) \simeq \sum_{(e:\mathcal{K}(G,n)\simeq\mathcal{K}(H,n))} e(*) = *.$$

Proof. It suffices to show that the type

$$\sum_{(X:\mathcal{U})}\sum_{(p:\|K(\mathbb{Z}/2,n)\simeq X\|)}X$$

is contractible. In the case n = 0 this is a theorem of Buchholtz and Rijke. We may therefore assume n > 0, and in particular that $K(\mathbb{Z}/2, n)$ is connected.

• Center of contraction: $(K(\mathbb{Z}/2, n), \eta(\mathrm{id}), *)$.

Contraction: Let X : U such that ||K(Z/2, n) ≃ X|| and x : X. Now it suffices to show that

$$\sum_{(e:K(\mathbb{Z}/2,n)\simeq X)} e(*) = x$$

is contractible. Since that is a proposition, we may assume $e: K(\mathbb{Z}/2, n) \simeq X$, and that e(*) = x. Therefore it suffices to show that

$$\sum_{(e: \mathcal{K}(\mathbb{Z}/2, n) \simeq \mathcal{K}(\mathbb{Z}/2, n))} e(*) = *$$

is contractible. By the lemma, this type is equivalent to the type of group isomorphisms

$$\mathbb{Z}/2\cong\mathbb{Z}/2.$$

Corollary

For any $n : \mathbb{N}$ we have

$$K(\mathbb{Z}/2, n) \simeq (K(\mathbb{Z}/2, n) \simeq K(\mathbb{Z}/2, n)).$$

Corollary

Any fiber sequence $K(\mathbb{Z}/2,4) \hookrightarrow E \twoheadrightarrow \|S^3\|_3$ is equivalently described by a map

 $K(\mathbb{Z},3) \to K(\mathbb{Z}/2,5)$
