

**WEATHERLOGICS**

**NHP Workshop – October 30, 2023**

# **HAIL MONITORING**

# **AT WEATHERLOGICS**

**Scott D. Kehler, M.Sc. – President and Chief Scientist**

# Overview

- Background
- Hail technology
  - Hail database
  - Radar processing
- Hail forecasting
- New Developments
- Questions

The background is a solid blue color with a subtle pattern of small, light blue dots arranged in a grid. A bright blue lightning bolt graphic is positioned vertically on the right side of the image, extending from the top to the bottom. The word "BACKGROUND" is centered in the middle of the image in a bold, orange, sans-serif font.

**BACKGROUND**

# Background - History

- Weatherlogics established in late 2016 by Scott Kehler and Matt Desorcy in Winnipeg
- Initially provided services for the agriculture and insurance industries
- Expanded to provide services to transportation companies and governments

# Background - Hail

- Matt Desorcy began collecting hail data in 2015 for some parts of the country
- Weatherlogics began collecting hail data nationally in 2017
  - Need for high-quality national data for real-time and historical purposes
- Weatherlogics established a system of data collection and quality-control based loosely on the European Severe Weather Database

# **HAIL TECHNOLOGY**

# Hail Technology

- Weatherlogics hail database
  - Our catalogue of hail events in Canada
  - Partnerships
- Hail estimates from weather radar
  - Software for processing radar volumes

# Weatherlogics Hail Database

- About 10,000 hail reports collected since 2015
  - Location saved (within 2 km or less)
  - Diameter (within 5 mm or less)
  - Time (within 15 min or less)
  - City, province, notes, etc
- Additional 20,000 reports from Manitoba and Saskatchewan from our partners at Coop Hail Insurance

# Quality Standards

- We have created a system of quality control that has three levels (QC0, QC1, QC2)
  - Quality-control level 0 (QC0): Hail is known to have occurred, but there is not enough information to accurately catalogue it.
  - Quality-control level 1 (QC1):
    - Hail location is known to within 2000 m
    - Hail size is known to within 5 mm
    - Hail time is known to within 15 minutes
  - Quality-control level 2 (QC2)
    - Hail location is known to within 250 m
    - Hail size is known to within 2 mm
    - Hail time is known to within 5 minutes

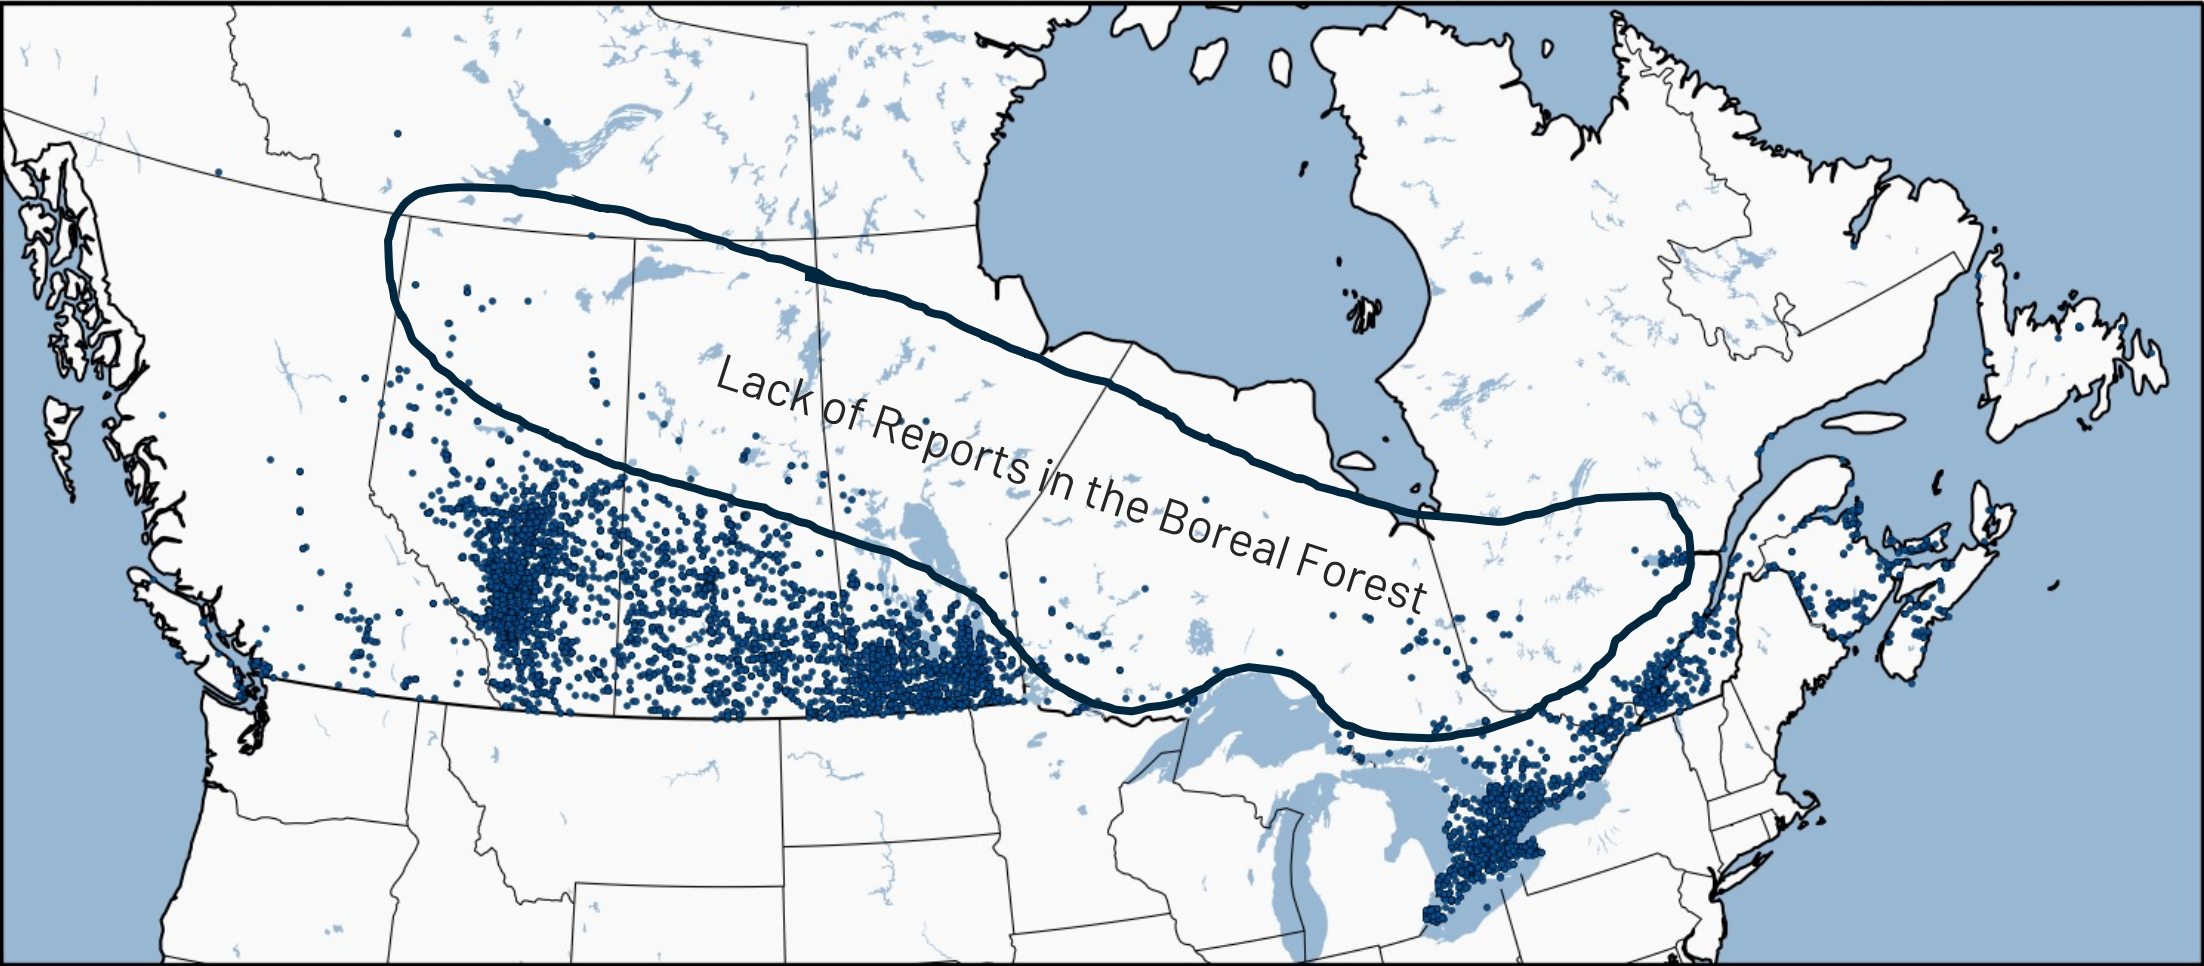

# Quality Standards

- If the location and time of a report can be accurately identified, but the size cannot, we do enter the report as “size unknown”
- We sometimes enter null reports if hail was expected at a location, but none occurred
- Maintaining high quality reports is critical. Hail is very localized and inaccurate/imprecise reports make research difficult or impossible.

# Partners

- We have partnered with Coop Hail Insurance to share hail claims data
  - Very useful to identify where hail has occurred
  - Data indicates date, location, and relative intensity of hail damage
  - Resolution about to about 400 m
- Also partnered with other crop hail insurers, but data cannot be shared
- Hope is that the insurers will eventually work together to provide a complete climatology of Prairie hail based on observed damage

# Weatherlogics Reports Since 2015

# Reporting Biases

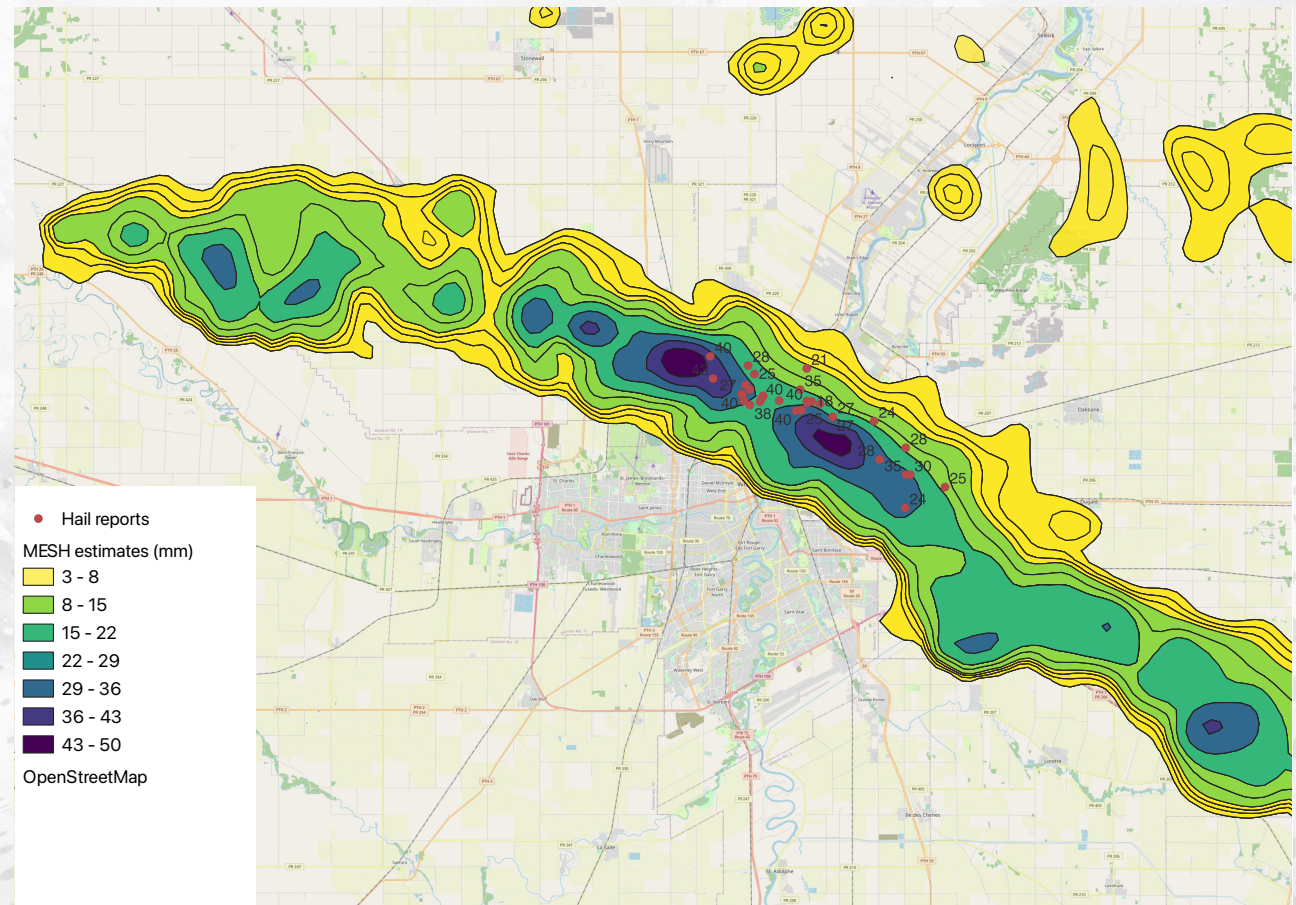

- There is a strong bias in reports towards large cities and agricultural areas
- We are certain that hail in the boreal forest is under-reported, we just don't know by how much
- Our team will make phone calls to identify hail in remote areas, but there is often nobody to contact within the path of the storm
- We have reviewed historical data that suggests there were very active hail periods in the 1980s and 90s
  - It is difficult to compare these periods to the present due to the significant recency bias caused by social media reports

# Weather Radar Processing

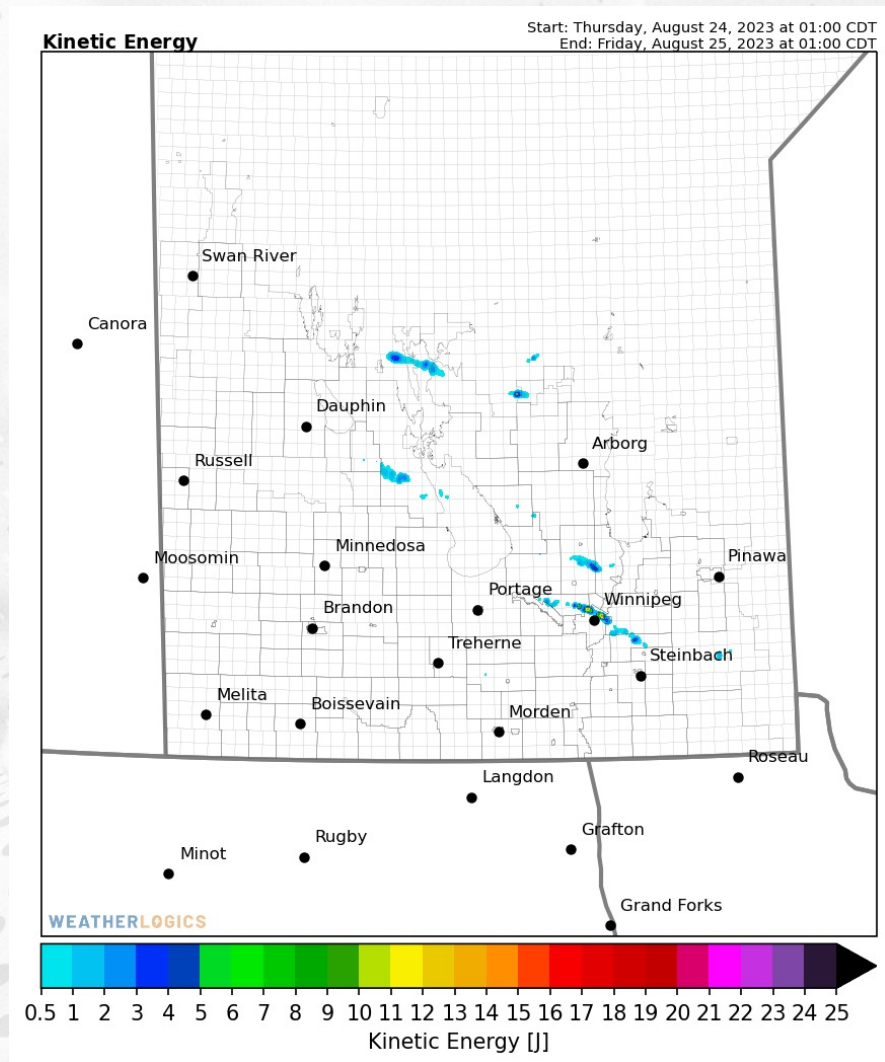

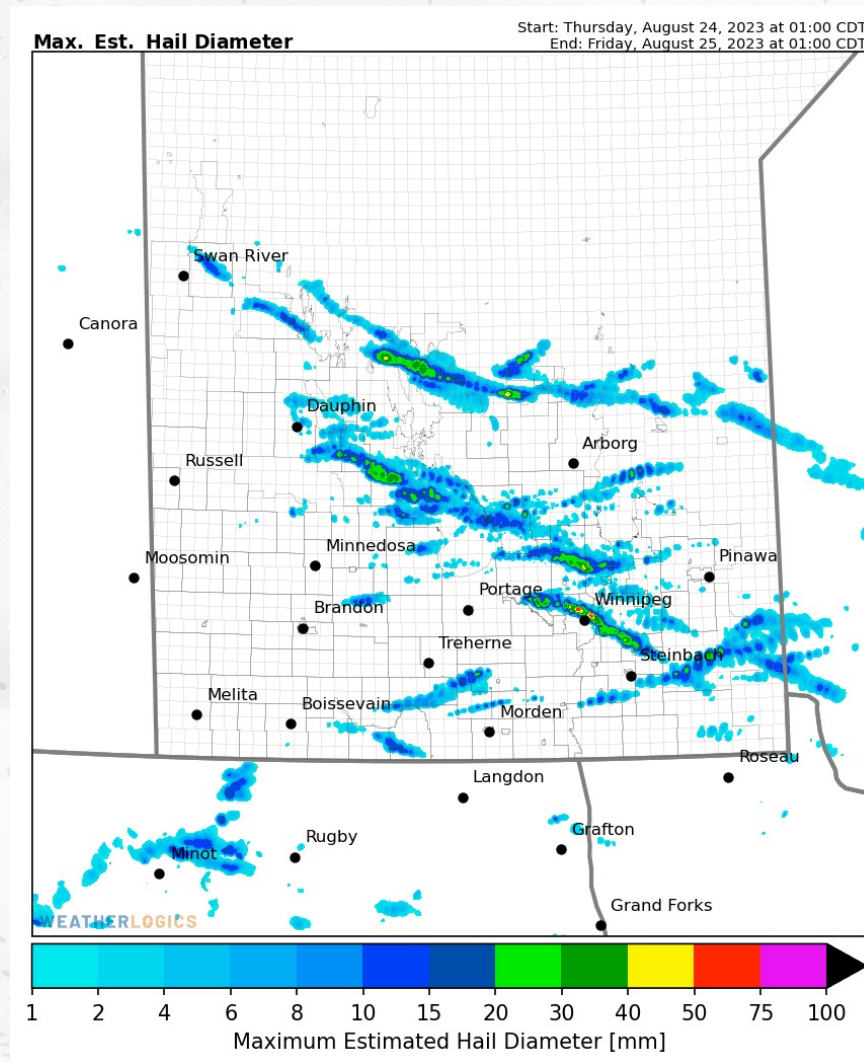

Winnipeg hail storm – August 24, 2023

- We have developed software to process Canadian radar volumes to produce hail swaths
  - Maximum estimate hail size (MESH)
  - Kinetic Energy
  - Exploring dual-pol products to improve estimates

# Hail Maps for Insurance

- Produce daily maps for crop insurers
  - MESH often doesn't tell the whole story
  - Duration of hail is important – small hail that lasts for an extended period of time is often responsible for crop damage

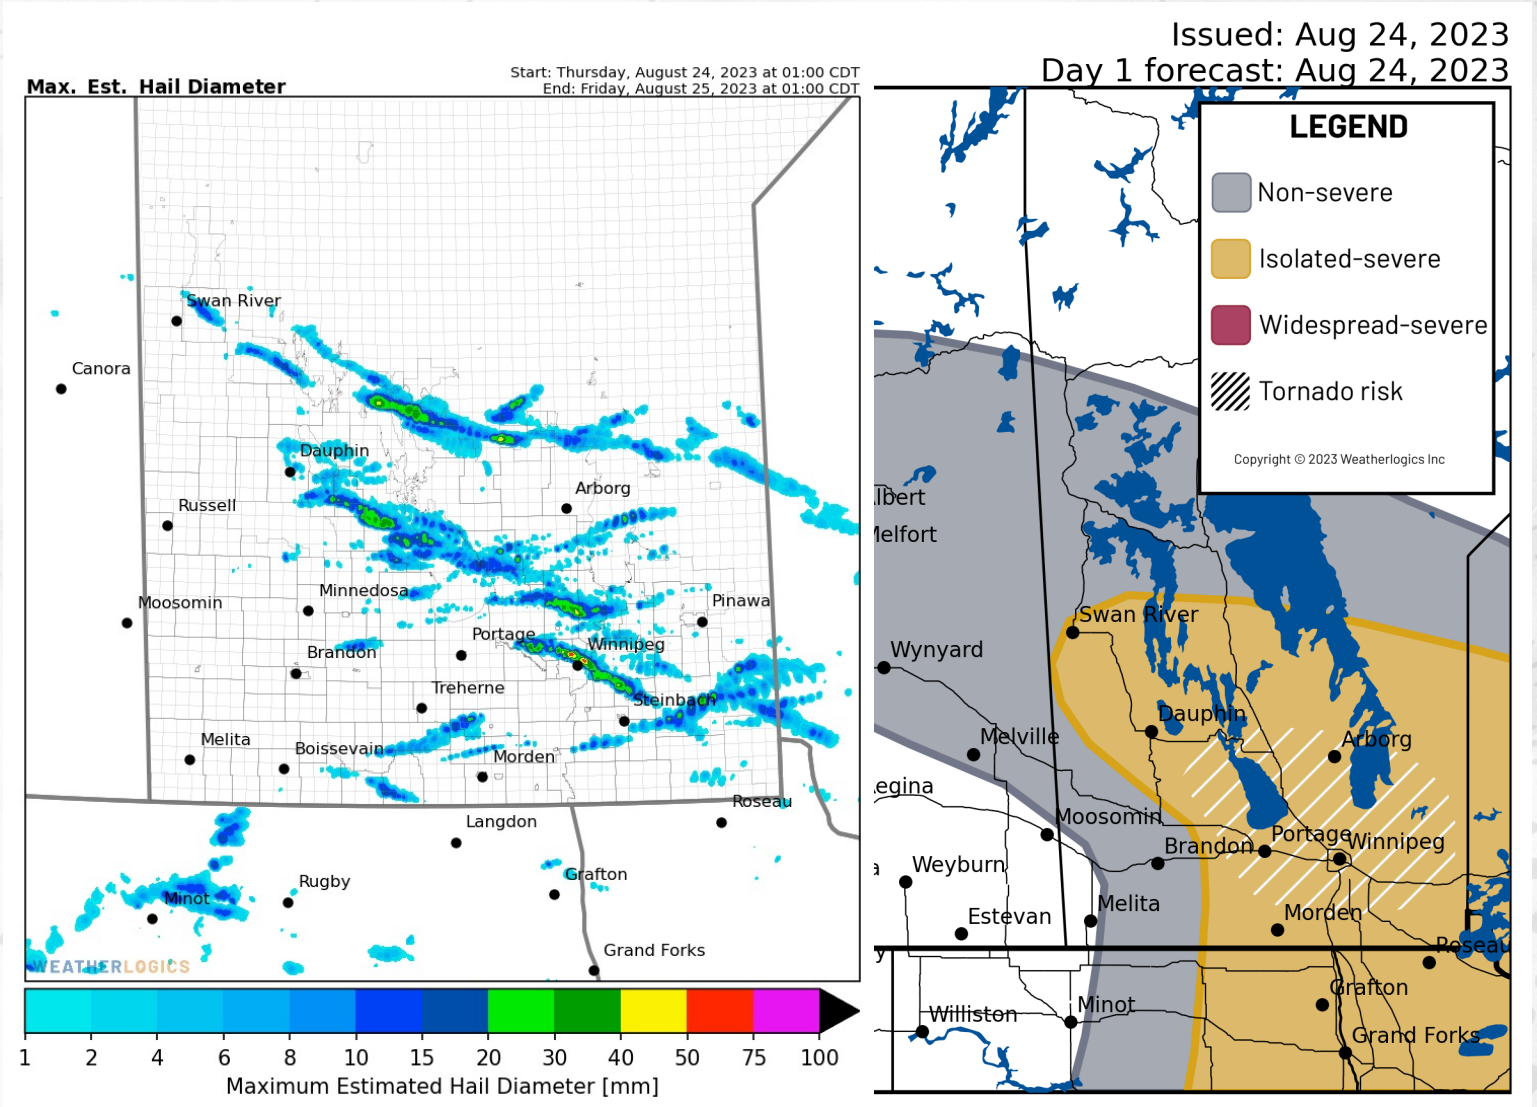

# **HAIL FORECASTING**

# Hail Forecasts

- Produce daily severe weather outlooks
  - Audience for maps is the public via our social media
  - Also produced for our own awareness as it affects insurance/agriculture
- Example – day of the Winnipeg hailstorm

# Real-time Monitoring

- Monitor hail as it occurs to alert certain clients
- Weather radar is a key tool, with dual pol making a big difference
  - Dual-pol can more easily show where hail is present in a storm and gives some idea of size
  - "Holes in differential reflectivity" combined with low CC are usually large hail

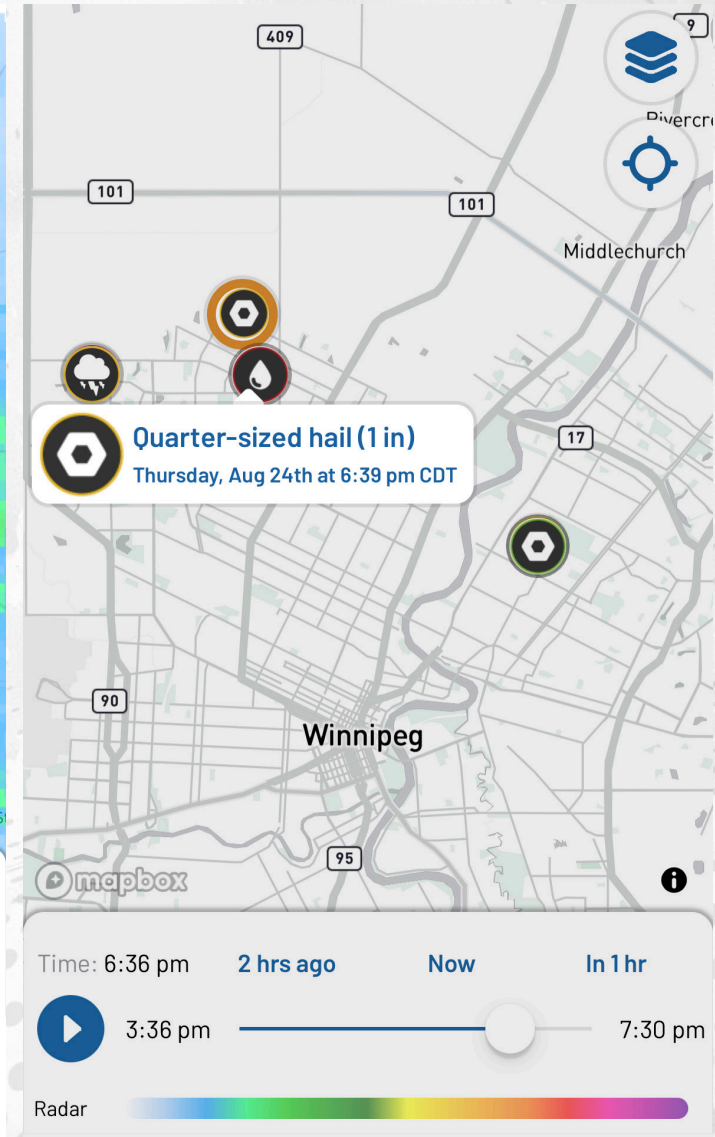

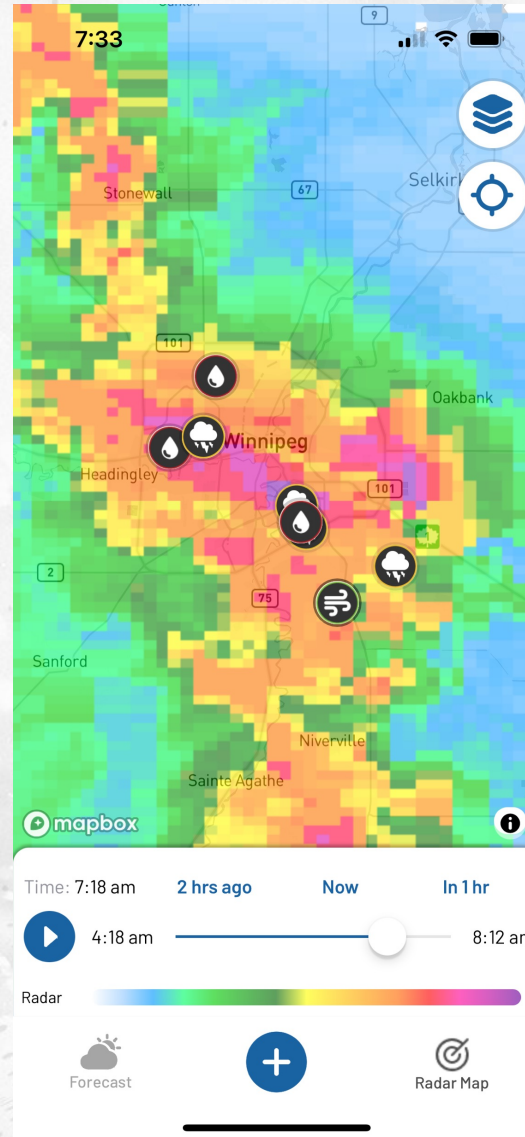

The background is a solid blue color with a subtle pattern of small, light blue dots arranged in a grid. A bright blue lightning bolt graphic is positioned vertically on the right side of the image, extending from the top to the bottom. The text "NEW DEVELOPMENTS" is centered horizontally and vertically in a bold, orange, sans-serif font.

# NEW DEVELOPMENTS

WEATHERLOGICS

# Weatherlogics App

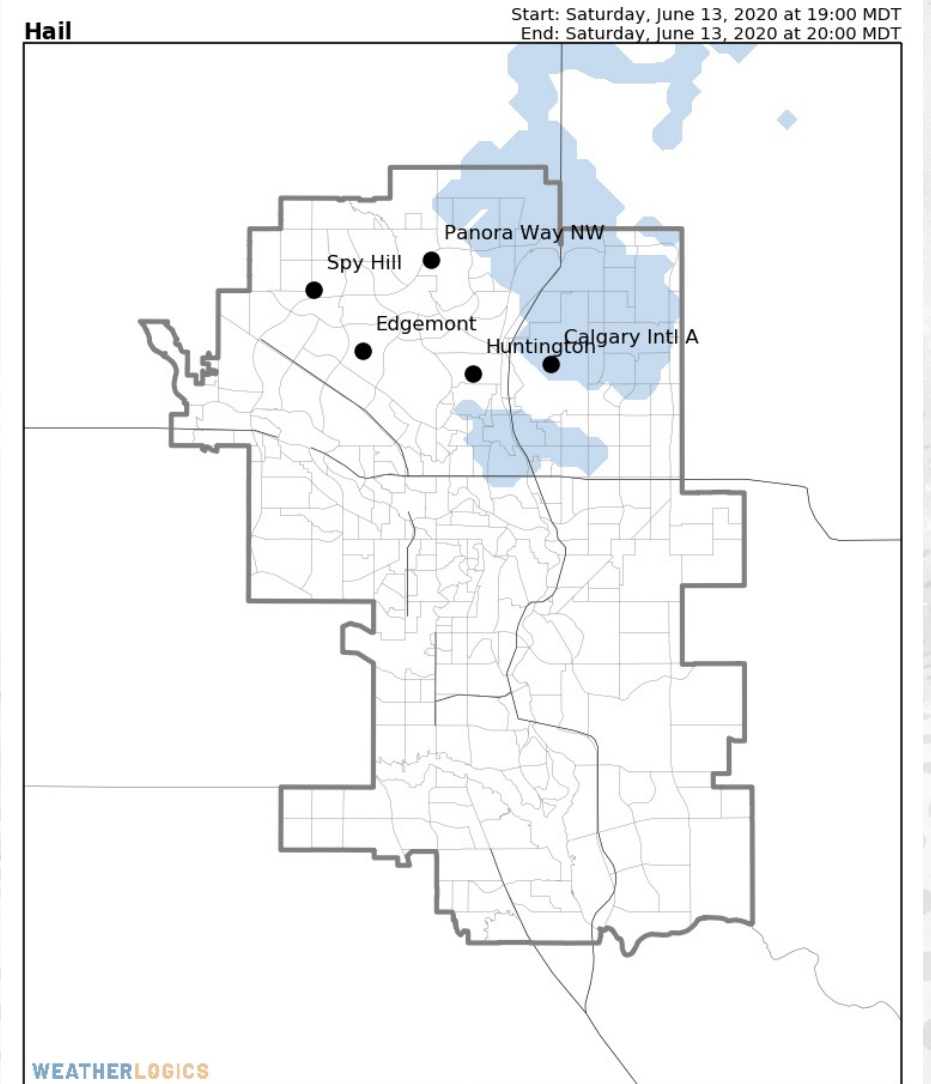

- Weatherlogics has developed a public app
  - Provides weather forecasts, radar, and road conditions
  - Users can submit weather reports
  - Tested over the summer with good success
- There is still lots of hail across the country that goes unreported

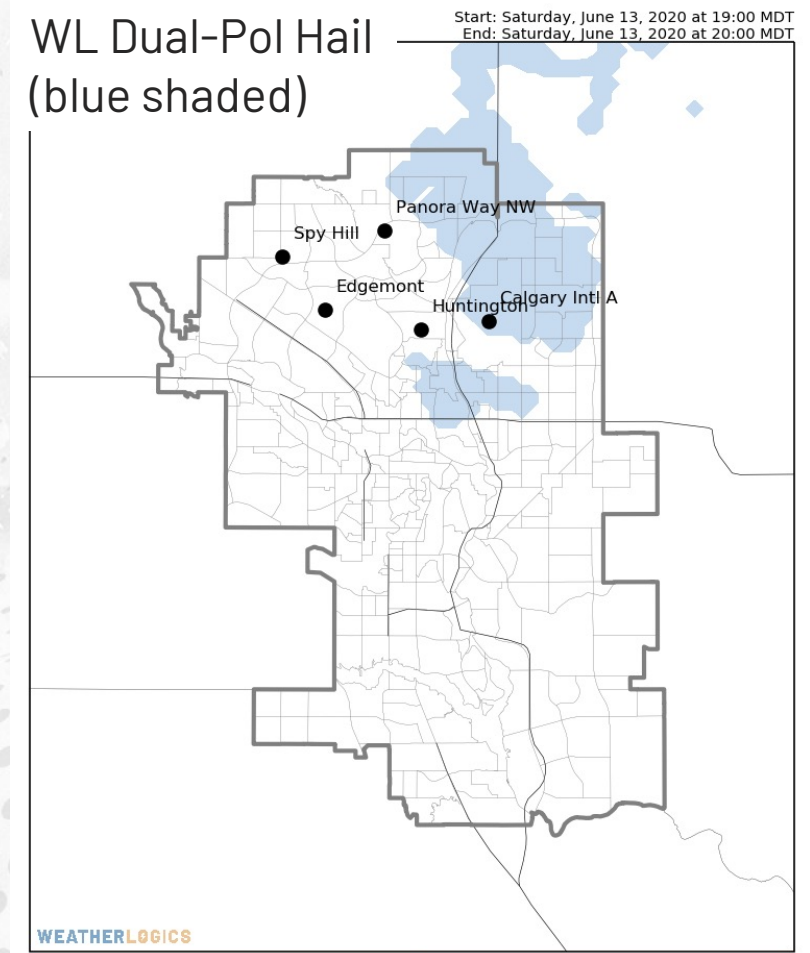

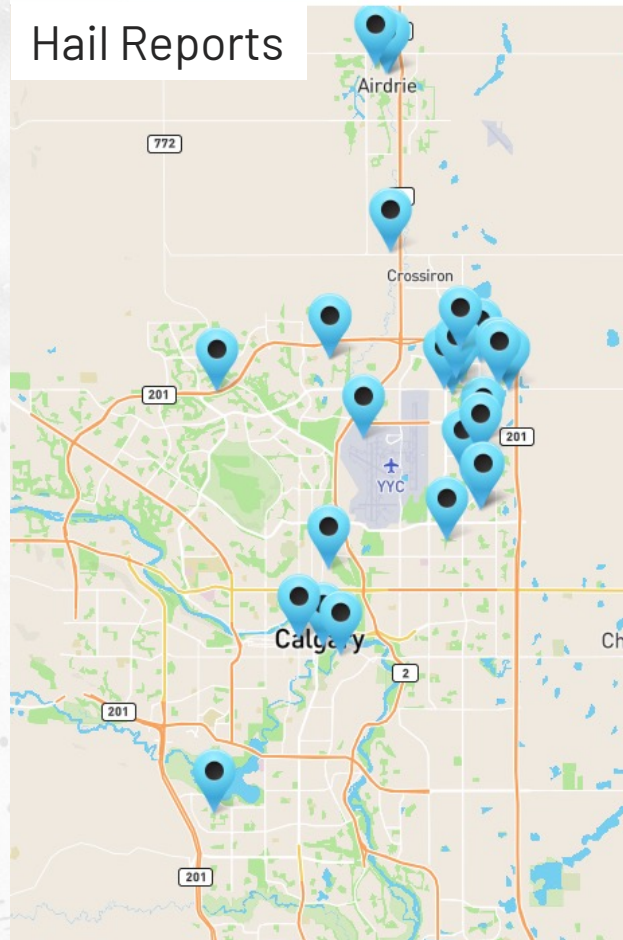

# Dual-pol research

- Dual polarization radar provides more information about particles within a thunderstorm
- Promising to differentiate hail from heavy rain
- Still not ready to make operational

## Weatherlogics Dual-Pol Algorithm Calgary Hailstorm June 13, 2020

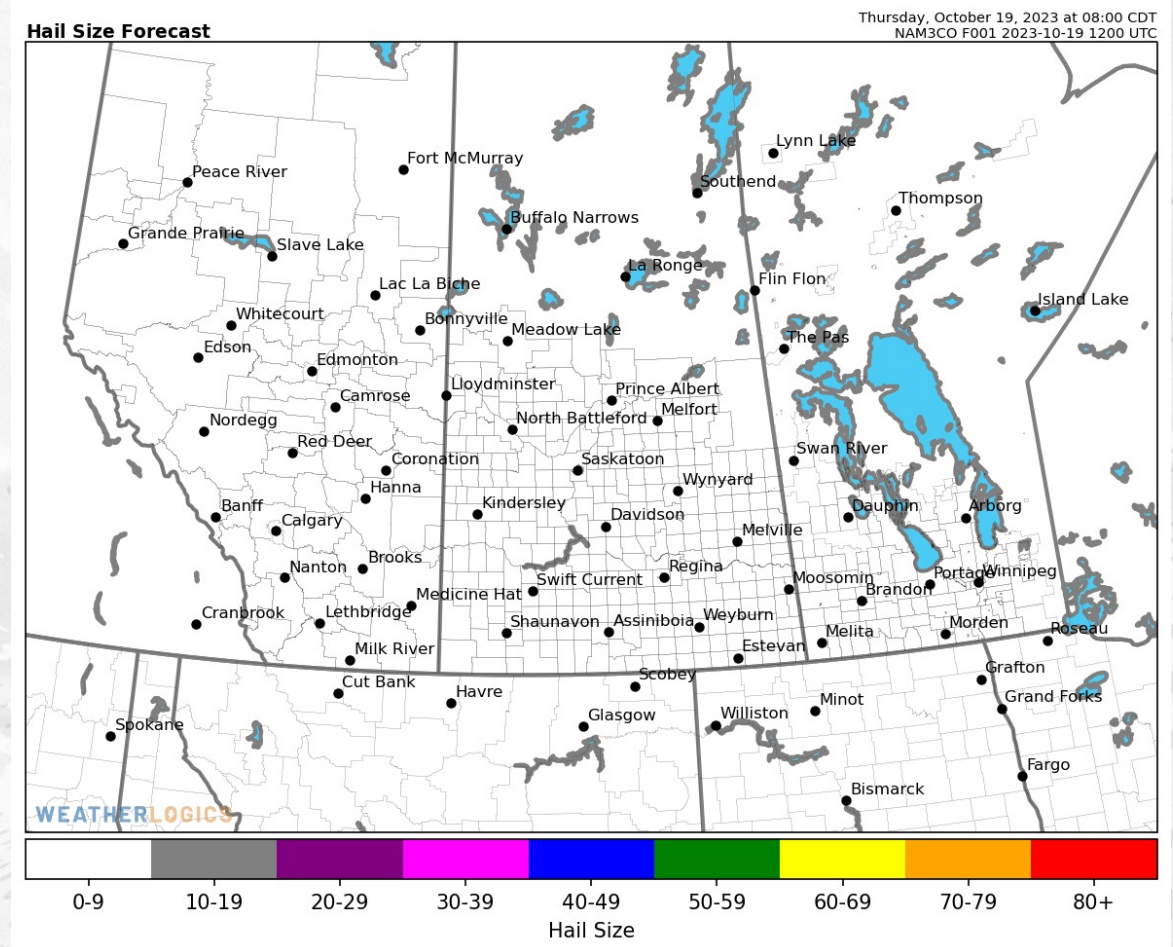

# June 2020 Calgary Hailstorm

# Experimental Forecast Products

- Available on the Weatherlogics Viewer Website
- “If a thunderstorm is present, how large might be hail be?”
- Developed by our UBC summer student in 2023 – will be tested more thoroughly in 2024
