DRAFT COURSE OUTLINE – SUBJECT TO CHANGE
PHILOSOP 9230A / PSYCHOL 9230A
PHILOSOP 4310F
Issues in Philosophy, Psychology & Neuroscience
T 2:30-5:30, SYNCHRONOUS ONLINE ZOOM SEMINAR

Professor Michael Anderson
WIRB 7174
mande54@uwo.ca
x85271

Professor Stefan Köhler
WIRB 5138
stefank@uwo.ca
x86364

This course explores areas of common interest between philosophy, psychology and neuroscience, including: consciousness, computation, representation, modularity, memory and embodiment, from both scientific and philosophical perspectives. We will also explore methodological issues, including the power and limitations of fMRI and other brain imaging technologies, and the structure of scientific inference.

NB: For the undergraduate students: this is a graduate seminar, cross-listed as an undergraduate 4th year advanced topics course in philosophy. If you don’t have prior experience in 3rd year courses such as Philosophy of Mind or Philosophy of Neuroscience, this is likely not a good choice.

Course Requirements

1. Readings as assigned
2. Attendance and participation in class discussion
3. Lead class discussion on one or more topics/articles. Link to sign-up sheet can be found here:
   https://docs.google.com/document/d/1DKkGOQDvy9YvDdVN1P6LFD9pntk92sV7x7ZlI989b9U/edit?usp=sharing
4. End-of term paper (< 5,000 words), or two shorter papers (<3,000 words each), or an experimental design proposal (see below). Undergraduate students are encouraged to adopt the 2-paper option.

We take it that the first three requirements need little explanation (although we will talk in class about tips for leading a good discussion). We are loath to put very prescriptive requirements on the term paper(s), because good philosophical writing comes in many forms, and at many lengths (and the variety may be even greater for interdisciplinary projects). *The ideal paper will engage both philosophical and empirical literature.*

We will distribute a couple of guides to good academic writing in general, and for this paper in particular, but the appropriate format, structure, and length of your term paper will ultimately be driven
by its specific aims. We will have ample time to discuss individual projects as the term progresses. Meanwhile: start developing a sense of who you think are the best writers, and what you think are the best articles, in your particular area of interest, and seek to emulate those examples.

**Experimental design proposal**

Finally, you have the option to research a topic of your choosing in cognitive psychology/cognitive neuroscience, and propose a study to address some open question in the area of your research. The proposal should be about 8-10 pages, in APA format.

The final proposal will include an **Introduction** containing a review of the primary literature to provide background information pertinent to your research proposal, as well as a statement of your hypothesis or research question; a **Methods** section outlining the design of an experiment that would help answer the research question; an **Expected Results** section in which you describe the possible outcomes of your study that would, and those that would not, support your hypothesis; and a brief **Discussion** section in which you discuss the broader implications and potential impacts of your study.

The topic can be anything, and it is most important that it be of interest to you. In researching and refining the topic you should look for two sorts of opportunities: ongoing research projects where a next step in research is fairly obvious, and topics on which there is disagreement, where a new study might shed light on the disagreement. The ideal proposal will be one that uses empirical methods to make progress on a shared topic of interest across philosophy and psychology/neuroscience.

When writing your proposal, imagine using it to convince the head of a lab to let you run the experiment. Be sure to address the questions the lab head might have, such as: what will we learn from this experiment? Why is it important to know that—that is, what are the possible broader implications? Ideally, the design should be such that you would be able to actually run the experiment. In practice, most studies require substantial refinement after their first formulation, and that will surely be the case here, but use the ideal as a goal to shoot for.

There will be a number of stages for the assignment, as follows. I’ll assign specific due dates prior to the beginning of the term.

1 page proposal for a topic, including at least three preliminary citations from the primary literature.

2-3 page refined proposal, including **at least** five appropriate citations. This revision should start to look a lot more like an introduction.

1-2 pages describing a **specific** research question/hypothesis, and outlining a preliminary experimental approach to exploring the question.

~8-10 page final research paper/proposal due, including: a review of the primary literature; a statement of your hypothesis or research question; the design of an experiment that might help answer the research question; a section on the expected results if your hypothesis is correct, and what you might see if it is not; and a brief discussion of the broader implications of the study.
Some advice

One important thing about this course: there is a vast literature on every one of the topics we will dip into here. The object of the selection is not to be comprehensive, but to choose readings that will spark the philosophical and psychological imagination, lead to fruitful discussion, and ultimately inspire you to dive into one of the subjects in much greater depth. They also have the function, for those interested in taking advantage of the Rotman/BMI partnership, of helping you develop the cross-disciplinary vocabulary that will help you be successful as a philosopher among scientists, and a successful scientist among philosophers.

Grading

2-paper option: Paper 1 40% of grade; paper 2 60% of grade
1-paper option/experimental design proposal: 100% of grade

Course Schedule (NB: Readings subject to change given sufficient notice)

Sep 15: Course Introduction

Readings: Thagard 2009; Stanford Encyclopedia “Philosophy of Neuroscience”
https://plato.stanford.edu/entries/neuroscience/

Sep 22: Embodiment (1)

Readings: Fodor 1981; Newell & Simon 1975; Shapiro 2011, Ch 1-2; Anderson 2013

Sep 29: Embodiment (2)

Readings: Anderson 2014 Ch 5; Wilson & Golonka 2013; Kaufer & Chemero 2015 Ch 5; Ch 9

Oct 6: Perception

Readings: Milner & Goodale 2006, 1-24; 43-66; Clark 2001; Akins 1996; Milner, 2017

Oct 13: Consciousness (1)

Readings: Chalmers 1995; Dennett 1988; 2001

Oct 20: Consciousness (2)

Readings: Owen 2006; Shea & Bayne 2010; Milner & Goodale 2006, 120-144; Mashour et al. 2020

Oct 27: Brain imaging (1)

Readings: Posner et al 1988; Anderson 2015; Poldrack & Farah, 2015; Kragel et al., 2018

DUE: Paper 1 (for those choosing a 2-paper option)

<Reading Week>
Nov 10: Brain imaging (2)
   Readings: Poldrack 2010; Kriegeskorte & Kievit 2013; Richie et al 2017

Nov 17: Memory
   Readings: De Brigard 2014; Robins 2016; Barry & Maguire, 2019; Moscovitch & Nadel, 2019; Barry & Maguire response, 2019

Nov 24: Modularity & Evolution
   Readings: Fodor 1985; Prinz 2006; Barrett & Kurzban 2006; Anderson & Finlay 2014

Dec 1: Predictive coding
   Readings: Wiese & Metzinger 2016; Clark, 2013 and commentary; Jones & Love, 2011 and commentary

Dec 8: The future of mind and brain
   Readings: Nunez et al., 2019; Boone & Piccinini, 2016; Krakauer et al., 2017; Elber-Dorozko, L., & Shagrir, O., 2019

Dec 18: Final paper due
